>I find it interesting that Rick Spanbauer measures spectrum in dollars.

Were it only Rick Spanbauer that measures spectrum in dollars
rather than mHz, there wouldn't be much to pine over would there?

Some notable quotes from the Business Week article (July 23rd issue)
were that ".. the While House still advocates selling off spectrum..",
and that FCC chairman Sikes ".. favors auctions for virgin spectrum..".
Do you still find my personal views interesting? My position is simply
that freebies promote inefficiency/waste. And that competition will
serve to deliver better services, at lower cost, that are useful to
more of the public. If this implies spectrum auctioning, I support
it.

> So what really happens? Can anyone in the Bay area tell us what happened on
> the cellular links during the big shakeup a while back? Some of you must
> KNOW what happens to the cellular services in these situations. Would
> you be willing to share your tales?

As I remember, the cellular system was operating, although overloaded
and slow like the rest of the network.

However, cell phones are not a good choice for use in a widespread
emergency anyway, especially around the SF Bay Area. Why?

1) If one is making a call from a cellphone to another cellphone in
the same cell, the signal is routed only through that cell
site repeater. But if the call is to ANY other cell or to ANY
wireline telephone, and this means the vast majority of calls, then
the signal is routed to cellsite #1, then to the cell hub
either by microwave link or by phone trunk, then to the wireline
network or to cellsite #2, as appropriate. That's a bunch of
places to fail; probably more than if the call went twisted
pair the whole way.

If the cell hub CO goes down (or the uwave dish is thrown out
of aim), all the users of that whole system are out of luck.
If a cell site fails or loses a tower, you'd have to find a
working cell somehow and hope it wasn't swamped.

2) There are two cellular providers in the bay area, as for other
places too. I have heard (from someone whose job is to care about
these things) that both the system hubs are in places that are not
considered seismically safe: one is on an upper floor of an old
building in Oakland, and the other is in a liquefaction zone
somewhere else in the east bay, from what I understand.

3) As has been pointed out before, these people are not in the game
for public service. They are in for PROFIT. The law of that game
states that service in adverse conditions is fit to be provided
only if the revenue to come from it times the chance of it
happening is greater than the cost of preparing for it. Does an
earthquake-tolerant cell phone system qualify for this? Probably
not for a big shaker, I would guess.

> Icom refuse to bring in the R1 on that basis. I keep hearing that
> there is a patent infringement issue involving Uniden that is the
> "real" reason that they are not being imported.

COME ON... the R7000 went on the market before all the fuss started
about being able to receive cellular on wideband scanners. I would
bet Icom has not had a production run of R7000's in a few years, and
probably never will again.

I'd much rather they crank out some IC-3GAT's, IC-338's, and that
all magical whizbang 28/50/144/220/420/902/1240 Mhz multi-mode HT.

The R-9000 is too expensive a radio for the cellular industry to get worried over. They are more worried about "everyone" having receive capability of cellular frequencies than in hos sophisticated the receive capability in this band of a few.

The R-7000 is a pointless case, because it is probably out of production forever now.

I'd suggest between 25 and 50 watts for 50 through 450 Mhz, and 10 watts
up to 3 Ghz, and 1 watt above that. A major reason for this is simply
the plethora of rig models already in these power ranges.

Take note that the current Novice Enhancement privileges allow 5 watts
on 1270-1295 Mhz, but all the rigs are either 1 watt (HT's) or 10 watts.

rewrite: This does not include the right to own a repeater.
into: This does not include the right to operate a repeater.

Tsk, tsk, Don. As a ham you should know that using radio
receivers within a commercial air transport (without permission
of the pilot in command) is verboden by the FAA. Potentially
dangerous to nav/com avionics on board.

A small chuckle once again, as yet another New Yorker/New
Jersyite discovers that southern California really *is* a
mobile society. Yes, we've used up all the cellular bandwidth,
as well as *all* the available Land Mobile bandwidth below 1 GHz.
Everybody out here has mobile two-way; about every third vehicle
on our freeways has a non-broadcast antenna of some sort on it.

I truly wish the rest of the country believed us when we say
that we know what massive spectrum congestion is all about.

It probably won't simplify things since recording CSCE data like this is
a new and different procedure they've never done before. It would probably
be best to just have a distince class.

> current licensees gain privileges. The only major loss, to today's
> General and Technician classes, is to the power limit, and both gain
> frequencies in return. Incentive Licensing was a disaster. Perhaps
> Qualification-based licensing can begin to undo the damage.

So what do I need to do to earn high power privileges? I have to learn
to learn something totally irrelevant to those privileges: Morse Code.
Not only that, but I have to go up to 13 WPM.

I don't mind having a more technical exam to get high power privilege,
and as a Tech now, I don't even mind having to go back and take a new
written exam to regain it.

But I just cannot support something that requires me to pass a Morse Code
test for ANY privileges that are not relevant to code, especially as they
apply to frequencies above 50 Mhz.

Fred, I believe you're heading in the right direction with this, but just
have stumbled with this particular one. Let's keep working on it, though.

In article <1105@ke4zv.UUCP> gary@ke4zv.UUCP (Gary Coffman) writes:
]Well lets review for a moment. We are discussing protecting a narrow
]band commercial receiver just outside an amateur band from the
]emissions of an amateur spread spectrum transmitter. Let's examine
]a worse case. Assume another amateur system inside the amateur band.
]Now with a SS transmitter spreading a 20khz voice signal over
]20Mhz, one one thousandth of the total power of the SS transmitter
]will appear in the passband of the narrow receiver. That's a 30db
]decrease. Now move the receiver outside the band and use a SAW filter
]on the SS transmitter that has ONLY 60db of stopband. Total power
]into the receiver will be more than 90db down from the total power of
]the SS transmitter. If the SS signal is reasonably clean and keeps
]it's intentional radiation inside the amateur band and the narrow
]band receiver has any front end filtering at all, we should see
]better than 100db isolation. This looks pretty good. As for wideband
]noise generated in the final amplifier, we do use tubes. :-)

Err... first of all, probably we are spreading at less than 1000:1 -
certainly if we are on 2 meters. Second, if the SS system is radiating
100W ERP (not unreasonable power), we are looking at +50dBm. So,
take your 100 dB of isolation, and you are looking at -50dBm of
noise into your narrow receiver. That's a LOT of power! As I was
pointing out, you need a large amount of isolation.
]
]As a practical example let's take the Grapes 56k modem. With it's
]tapped shift register randomizer, it can be considered a somewhat
]narrow (70khz) spread spectrum source. On one of our sites we have
]one mounted in the same rack with a narrow band receiver operating
]300khz away from it's channel center. We haven't noticed any
]desense or intermod to the narrowband equipment. We did wind up
]adding a cavity to the output of the modem, but that was because
]the narrow band equipment was desensing our modem enough we couldn't
]copy a weak signal from one of our other modem links.
]
Specifically, 70kHz is narrow enough to allow running it through a
cavity, which you did. That adds a lot of isolation. In fact,
running 56 kB through 70 kHz is nowhere close to "spread spectrum" -
you are running slightly over one bit per Hz. I would expect
real spread spectrum to be way down from that.
]Most commercial sites typically want a microvolt or two at their
]receiver and most proposed amateur SS equipment will run modest
]power. I don't think there will be any problems at a well engineered
]site. No doubt there will be problems at many of the poorly
Around here, more like .5 uV, which is -113 dBm, with site noise

around -118 to -122.
]engineered sites that I have had the misfortune to use however.
]One particular site that I am thinking of has 200 transmitters on
]about 2 acres of mountaintop and the best engineered equipment on
]the site is in the two amateur installations. We're talking unshielded
]cabling, unshielded racks, unshielded PAs(!), mobile units pressed
]into repeater service, and even Radio Shack coax on UHF equipment.
]With those kinds of problems, they're not going to notice a SS
]transmitter.
That sort of transmitter density is normal around here, but unfortunately
it is frequently the amateur who has the worst installation. We do our
best to combat this, through forest service inspections, and
coordination technical requirements.
]
]Gary

>the time, on the air, but will not send any cards out. The card
>collectors will soon lose interest in such stations and leave them free
>to those genuinely interested in DX (rather than awards) and/or ragchewing.

Unfortunately the word doesn't seem to get out to the DXers that a
station does not play the DX game. Thus every time he gets on the
air he becomes the victim of a pileup. This leaves a very bad impression
with many operators and they QRT permanently. Since most of the rabid
DXers seem to be US based, this gives the US a black eye.

Since DXing is a form of contest operation, restricting contacts that
count toward awards to six contest weekends a year makes a lot of sense.
The operator in a rare country can get on the air the rest of the year
and enjoy his hobby in peace. Those who like to talk to distant places,
as opposed to the contest style operators, will be able to work the
rare ones in a meaningful way without the insane pileups.

Wayne has finally come up with a good idea. If this is implemented,
I might even get back on HF more frequently. As you might guess, I
am not a contest operator and enjoy actually talking with people
in other lands.

Gary

> manufacturers of this equipment be easily found?

Whoa there..... The lower end of six is the province of the DXers.
For example 50.110 and 50.125 are SSB calling frequencies, and CW/SSB is
common up to at least 50.200 +.
If you value the health of your model, you will choose more conventional
model-control frequencies on 6. For example the ARRL Bandplan now talks
about 50.8 -51.0. Traditionally model control has been up in the 53 + region.

I can't suggest specific equipment, sorry.

>My question is: Why does anyone want a 'private'
>repeater? IMHO a mixture of elitism and one-upmanship?
>And *such* a poor use of spectrum-space!

You'll get many inflammatory replies to this one from the anti-FM repeater crowd; here's an attempt at an informative one:

Here, repeaters can be placed on the air by any ham with a Technician or higher class license. Sometimes, for various reasons, the person who's sunk thousands of dollars into the machine wants people who use it to help him with the expense of maintenance and operation, as well as the up-front cost of the machine. Other times, as with the repeater I hang out on, the trustee simply wants to make sure that the user understands unusual features of the repeater before beginning to use it. Finally, the repeater may have been placed on the air for a specific purpose, and the trustee wants to make sure that that purpose is adhered to.

The FCC, recognizing that there is a place for private repeaters, specifically allows them in the amateur rules:

S 97.205 Repeater station.
(a) Any amateur station licensed to a holder of a Technician, General, Advanced or Amateur Extra Class operator license may be a repeater. A holder of a Technician, Genera, Advanced or Amateur Extra Class operator license may be the control operator of a repeater, subject to the privileges of the class of operator license held.
[...]
(e) Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled functions of the station. Limiting the use of a repeater to only certain user stations is permissible.

Yes, I agree that some closed repeaters are that way only because the owner doesn't want anyone but his buddies on it. Those, though, are in the minority - and, just like a computer on the Usenet, it's HIS repeater, and he may operate it in any manner he wishes, as long as it's in accordance with the rules. He has just as much right to operate it as a club that's altruistic enough to let anyone and everyone operate on it.

If only it were so! Much of our UK VAT goes to fuel European Subsidies to
inefficient agriculture in faraway lands...
I dont know what the current import duty on radio gear is, but that there
is any import duty is all wrong. Import duty is simply a particularly
pernicious and unjust form of arbitrary protectionism.
REMEMBER: ALL TAXATION IS THEFT!

> What's going on here, eh?

If one of the articles has a good color photo with it--or
if one can be shot--it will probably end up on the cover (see July
QST, for example). If no good color is available, they'll run
something else. This happens very seldom, though, except for:
1) the annual national convention cover, and 2) special-purpose
stuff like the 75th anniversary covers you mentioned.

Looking at the 8 issues of QST so far this year, only the August
issue has a cover that doesn't go with an article in that month's
issue (except for the convention cover). (September's cover is
about the lead technical article.)

Urban Legend Alert! The pilot of a commercial air transport plane
DOES NOT have the authority to let you use the radio on the aircraft.
It can only be used if it is tested with that aircraft for interference.
I don't know the name used for this testing, but it is similar to type
certification and not likely to actually happen. This rule is an FAA
rule related to IFR flight.

The way I listen to ATC in an aircraft is to use a passive receiver -
just a tuned crystal (well, alright, diode) detector and an
audio amp. It looks like a walkman, and cannot cause interference
because it has no RF oscillator. I don't know if it is legal or
not, but my guess is that it is.

>dangerous to nav/com avionics on board.

Close. Without permission from the OPERATOR OF THE AIRCRAFT, i.e.,
the airline. The pilot has no say in the matter under part 121 of
the FAA rules, which governs air carrier flight.

And judging from what the IF stage of your typical walkperson does
to the heterodyne of my aviation handheld, I can certainly understand
the prohibition.

I have had people on board a small aircraft operate 2m handhelds while
in flight, however. We checked to make sure nothing funny would happen
to the comm radios on the ground before starting up, and the ham HT
didn't seem to bother them at all. It was kind of fun talking simplex
over a distance of 50 miles from a handheld.

I did, however, once get a stern warning from a flight attendant not
to use my "cellular phone" on a commercial flight. Humf. At least
she was closer to describing it than most other people I've encountered,
who tend to call it a "pager." I mean, really. A 24AT is pretty small,
but if a pager company tried to give me a pager that size, I'd complain
quite loudly.

Incentive licensing was a still born idea. Where is the incentive
to upgrade when the only priviliges are a bit more bandwidth in some
bands where a good number operators have no interest. For me, HF is
nothing more than a curiosity but I have no real interest in HF
operation. I have a Technician class license which gives me all of
the privileges I need to do the things I'm interested in. There is
no bone to go for in upgrading.

We do indead have too many classes of license for which constant
upgrading is a drain on the resources of the FCC. As was pointed out
in the NTRN broadcast, the FCC can't process more that a certain number
of applications a year. Even if they could modify the program which
tracks the licenses to accomodate a new class, we still could not get
any more people per year into ham radio because of the number limit the
FCC has. Do away with the multi-level incentive licensing program and
install a simpler dual-level system where a code proficient operator
has full privileges on all bands and a no-code operator has full
operating privileges from 30Mhz up. This would relieve the load of the
FCC by DRASTICALLY reducing the amount of paperwork each year just to
handle upgrades leaving that much more time to process NEW applications.
The no-code license would then probably draw more new people to ham
radio, swelling our ranks and quiet possibly saving the spectrum we have
in the V/UHF bands. The FCC would be able to handle this rise in new
application now since they would be handling fewer upgrades.

That is when I first noticed it too. Despite the complaints on here
(IMHO unfounded) that the ARRL is only interested in ancient technology,
I was looking forward to reading some "old-timey" material behind
the "classic covers." It was a bit disappointing.

>collectors will soon lose interest in such stations and leave them free
>to those genuinely interested in DX (rather than awards) and/or ragchewing.

But how are the DXer's supposed to keep track of which DX stations QSL, and which want to ragchew? (And, for that matter, how many DXers would BOTHER to keep track?) There's still going to be a pileup every time the DX station gets on the air, as long as we do nitwit things like hand out pieces of paper if you contact enough "countries." I agree with Wayne on this one - can anyone really justify the existence of the DXCC as it is presently structured? And before you answer, have you listened in on 20 on a regular basis, and thought what it would be like to be on the other end of some of these pileups EACH AND EVERY TIME you got on the air?

(Some food for thought - what if DXCC-type "country chases" were restricted to certain periods, something like an ongoing contest? Maybe every fourth Saturday, contact made during the 24-hour period from XXXXZ to YYYYZ would be acceptable for DXCC. That way, the paper-chasers could keep things going, and the rest of us could have some enjoyable QSOs.)

> except current Extra sub-bands.
> 3) Advanced - 13 WPM plus Advanced written test. All privs.

I could be happy with this if you made 2 changes:

4) Extra - 20 WPM plus Extra written test - satellites, keep the
EXTRA portions of HF bands, plus for the V.E. program.

and one other: the "full VHF privileges" concept should not include the
CW-only portions of VHF bands (Yeah, yeah, 100 KHz on 144, I know, it's
measly, but I think that even STRONGER steps should be taken in this
direction. If the idea here is to get MORE (better?) hams, then the VHF/
UHF bands will crowd up, and I think that more should be done to protect
weak signal operation in these bands).

There is a significant difference between the computer on Usenet and
a repeater. The computer does not tie up any significant natural resource.
The repeater does: its frequency pair. Here in Arizona its frequently hard
to coordinate frequency for an open repeater, simply because closed
systems already control the frequencies for an area. I think this
is completely wrong, and an abuse of the public trust. I am opposed
to the coordination of ANY closed repeater. Sure... put up a repeater
and close it. But don't expect it to have any claim on either the
input or output frequency! If I want to carry on a simplex conversation
on the input frequency, using the repeater's PL, that is my right!

I have IC-2sat, which is supposed to not receive below 138 mhz. I performed the multiple-button-push mod to be able to enter the 10 Mhz digit directly. Now, when I tune to 135.65, the radio gives me a "U" in the channel display indicating that it is not locked. However, the radio does receive just fine! 135.65 is SFO bay approach, btw. Also, farther down the aircraft band the radio does lockup, i.e. it doesn't give me the U.

There is another mod for this radio that enables super wide range receive; like 0-900mhz. Of course, I got "U" all over the place, but maybe I could actually receive on those freqs? I reset the radio, though, because the sensitivity on 2 meters seemed to get worse.

>So what do I need to do to earn high power privileges? I have to learn
>to learn something totally irrelevant to those privileges: Morse Code.
>Not only that, but I have to go up to 13 WPM...

I thought about that. The idea behind the easiest (neo-Novice) license is to pick up about 90% of current VHF operation. It picks up FM chatting (repeater users, not operators -- my "owner" meant "licensee of"). It picks up packet. It picks up most SSB. It intentionally leaves out "weak signal" and especially "moonbounce". Both of those tend to use high power, and both tend to be done on CW! (Weak signal terrestrial is often SSB, but serious weak signal work often falls back to CW.)

For 5 WPM, you get a somewhat higher power limit on VHF/UHF; I didn't mean to limit Generals to Novice levels. (Except maybe on HF, where Novice power is a-plenty!) I suppose some moonbouncers may not be good at CW, but how big a problem will that really be? In the interest of simplicity, of course, I don't want to add a super-VHF license.

Very few hams need more than a hundred watts or so on VHF. BTW, I don't have a problem going to 10 or 25 watts on 1240 and up, from the current novice 5 watts, since reality says we have to match Japanese radios and not the other way around.

>spectrum congestion is all about.

BS Gordon. At least 420-450 is completely empty out here. Listen to it sometime. The spectrum is completely "used" by private repeaters that are almost never transmitting! You can't get a new allocation.

I think that this "private repeater" idea has got to go if we are to keep our spectrum. Just wait until UPS listens to 420-450 here in Southern California and decides that they need a chuck of it. All they have to do is go to the FCC and tell them that while we have many repeaters in the repeater directory, none of them are ever in use! The spectrum co-ordinators in Southern California have their collective heads in the sand (or smog - whichever is appropriate).

But a cellphone of that size would be really great, especially with all
the receive capability of the 24AT.

Yes, but the point that the cellular system could be made reliable
in the face of disaster seems to be a difficult point to grasp for
some in this forum. Just as there are government mandated building
codes, electrical wiring codes, etc the cellular industry could have
a disaster emergency service role imposed on them through government
regulation. The simple fact of the matter is that the cellular
industry IS a for profit enterprise and thus potentially has a lot
more money than does ham radio to setup formal emergency service
networks. And the imposition need not be a hardship either, as it
could be funded through tax incentives much as the alternate energy
initiative was handled a few years back.

> it.

While the REPEATER may be his, the FREQUENCY (pair) is not and cannot be under our rules. Even the fact that the coordinator has coordinated the repeater does not make the FREQUENCY his.

The actual function of a coordinator, despite what coordinators, owners, and user might WANT to think, is to determine a frequency which has a reasonbly low probability of causing and receiving harmful interference.

Also, the FCC policy only deals with interference situations when it is considers to find in favor of coordinated vs uncoordinated repeaters. If interference does not actually happen, there is no problem.

Apparently most CLOSED repeaters have some mechanism to avoid being used by "non-members" such as CTCSS (PL) or DMTF codes. I'm not going into what methods are good or better, but just mentioning that they exist. These methods would allow the lesser used and controlled access closed repeaters to SHARE the same frequency pair with nearly no interference problems.

If two repeaters are on the same frequency pair at the same location with different access means, when one is in use the other cannot be used, so no one should try. Remember that it is wrong to transmit on a used frequency, and this is probably extendable to the repeater output frequency when you know that your transmission is being repeated. Further, if these shared repeaters detected the other being busy and not key up, then there would be virtually no interference problems.

The CLOSED repeaters have virtually no usage, because most of them are that way to limit the range of people using them. The CLOSED repeaters are taking up repeater spectrum space. However in the big cities where there are no repeater pairs remaining on 2 meters, the OPEN repeaters are mostly underutilized as well, so in reality, I don't see much of a problem with CLOSED repeaters at this time. There is just not much of

a need yet to get any more repeaters on.

But there is one place where the sharing of CLOSED repeaters could be tried. That is on the 222-225 Mhz band now being compressed on us by the land mobile grab. Although the portion remaining is already occupied by repeaters, the repeater subband needs to be shrunk by 40% to make the change fair to all. It is clear than many repeaters will have to change frequency, but I believe it is NOT necessary to take any off. What you do is start SHARING the spectrum. Where you have two CLOSED repeaters very close together, put them on the SAME frequency pair and require them to use some access control mechanism, and suggest they also have a means added eventually to detect the usage of the other. Alternatively, the two repeaters could be merged into one, and perhaps have 2 or more CTCSS tones to isolate the groups if they don't want to talk to each other.

Of course. But how is this worse than amateur radio when everyone picks up their microphones at the same time? Or worse, when ONE person refuses to give up a repeater to emergency use?

Yes and no. Yes, a closed repeater is the property of its owner and he
doesn't have to let anyone use it. On the other hand, the channel on
which it operates is NOT his property, and he has no right to deny
it to others who would operate an open repeater on it.

>3) As has been pointed out before, these people are not in the game
> for public service. They are in for PROFIT.

Okay, then why is it standard practice in the telephone business to supply battery power for telephone switching machines and transmission equipment when it's needed only a tiny fraction of the time? As anybody who has priced a big UPS will know, backup power can be very expensive, and many computer sites opt to go without it. But the Bell companies not only consider standby power to be essential, but they go well beyond the usual 5-30 minute capacity of the standard computer center UPS.

A typical CO battery plant is sized for 3 to 8 hours of reserve time, and this is usually backed up with a diesel or gas turbine generator with days to weeks of fuel on hand. If the site is remote, the battery may be sized for 24 hours of operation, there may be a second generator, or solar power may be used. Smaller offices may do without a dedicated generator and rely on their 24-hour battery plants until a portable generator can be brought in when necessary. (Reference: "Engineering and Operations in the Bell System".)

The reliability and availability of the public telephone system has always been a high priority with the Bell companies. Believe me, they are VERY concerned with maintaining service during an emergency, and this commitment has continued unabated since divestiture.

I would argue that most amateur radio facilities are nowhere near as well maintained and backed up as the average telco facility.

>with many operators and they QRT permanently. Since most of the rabid
>DXers seem to be US based, this gives the US a black eye.

A DX station can pretty much determine the type of action they see
on the bands by how long the DX station chooses to stay in QSO
with a given station. If he wants to rag chew it just isn't
that hard to control.

Another point that needs to be made is that the US isn't even close
to having a monopoly on bad operators. Having been on the receiving
end of more than a few big pileups in the last 10 years I've heard
rotten operating from stations all around the world. I'm not going
to bother and single any particular country out but we(US hams) have
loads of competition for the title of "lids of the year."

I was half thinking of attending our local hamfest, and picked up some of the literature advertising it. On page 2, where the events are listed, there's a paragraph headed "A Word to the Ladies..." - this sounds like a bad start, and it is. "Learn new make-up tricks and how to keep your skin and nails beautiful.... no need to stay home!... "a craft for you to "make and take"".

This is downright degrading. I know that ham radio is predominantly a male hobby, but this sort of garbage just perpetuates the system. At least in my own field, astronomy, when astronomers have conferences they have the sense to realize that accompanying spouses can be of either gender, and arrange e.g. local tours, which are equally suitable for men or women.

This meeting is organized by the ARRL West Gulf Division. I've never really cared who the director is, but I do now. I'm certainly not going to their silly meeting and I'm not going to vote for a male chauvinist pig the next time around (not that I did before).

Which century are we in, anyway?

This is a widespread characteristic of hamfests. At our hamfest
this year the PA announcer (who is a woman and I think is also licensed)
made the following announcement:
"ALL ladies...ALL ladies...there will be bingo held in forum room 2...."

She really stressed the word ALL. I couldn't believe it.
I know a fair number of women who attended the hamfests to look at
radios, not play bingo.
The Co-chair of the Hamfest Committee here is also a woman, and I am sure
she didn't arrange all of this to play bingo either.

Maybe instead of having "Ladies events" we should have "Non-Amateur"
events, or something. While we are on the subject, any suggestions for
good non-Amateur events for hamfests?? The only things I have seen
are make-up and crafts (as mentioned above), bingo, cooking demonstrations
and bus trips to a local shopping mall.

[-=-]

I will be going to St Martins (the Dutch side) in a few weeks on
business and was wondering if anyone has answers to the following.

1) Is the ICOM R1 radio available here? If so, what is the price and
its frequency range? (French or Dutch side of the island)

2) Is the electrical service 110 volts like here in the states? (If
not ill just pack lots of batteries for the radios ;-)

3) Will I still be able to listen to my favorite north american short
wave broadcasts? (Deutsche Welle, Radio Berlin Intl, BBC) Or must
I switch to the central (south ?) amercian frequencies?

Any and all answers (serious ones that is) are welcomed.... E-Mail
please unless all else fails.

There is an entirely adequate circuit in the 1989 ARRL Handbook. It describes a 3-in-1 one audio filter - 300-3000Hz, 300-2700Hz, and 650-750Hz. I built one myself, and have had good results with it. An audio filter doesn't help on front-end overload though, and I get creamed by adjacent signals that are MUCH stronger than what I am tuned into.

The circuit runs off +/- 12 volts, but it could probably be modified to run off a single supply.

The 89 and 90 handbooks also have a section on bandpass audio filters based on op-amps, so you could easily roll-your-own.

I also took the time to consult some of the Engineering books on the subject of active audio filters, and didn't find anything that was simpler or more effective than the 2-resistor 2-capacitor bandpass filters discussed in the Handbook.

With all due respect to those arguing the cellular issue, I'd like to bring up a shortcoming of cellular service. The "Carbon Canyon" fire of Southern California fame consumed some 4000 acres and 14 homes. Carbon Canyon (and other adjacent canyons) are convoluted enough to impose predictable radio problems.

In a community meeting dissecting the lack of response and organization of emergency services, one of the excuses presented was loss of radio and cellular contact by emergency vehicles. The people responsible for managing emergencies were clearly clueless with respect to the technical issues of communication. The notion of repeaters and dead spots had to be experienced (at the cost of property) instead of foreseen.

So I'm sensitized to the fact that our government emergency communications are handled by people who see cellular/radio technology to be the same as a telephone, which it's not. Were an experienced ham involved with the communication planning, I'm sure he/she would have been losing sleep over how to place repeaters for maximal coverage of our canyons and communities. I doubt that the local cellular service providers are interested in adding the two repeaters needed to meet the emergency communication services for our area.

Sounds like you are getting destructive interference. Is your vehicle
about 16 feet long? If so, you are exciting one end of an open 1/4
wave stub. Naturally, you are going to see a strange feedpoint
impedance. Try temporarily moving the antenna off the mirror and clamp
it somewhere back along the middle of the van, say at the open side
door. I think it will tune up well there. If it does, you'll know what
the problem is. As for the fix, I will leave that to your imagination,
but one hint is that it requires an electric drill :-).

The question boils down to: "Is an open repeater always better for ham radio than a closed repeater?". My answer is "Yes", "No", and "It depends".

Often the most technically sophisticated, lively, and interesting repeaters are the nominally closed ones. And the most boring, and ineptly operated ones are nominally open. Sometimes it's the reverse. It depends on the group sponsoring the repeater and the function it is intended to serve. If the machine is intended to serve as a technical intercom between experimenters, it is often interesting and serves the best interests of amateur radio. If it is intended primarily as an autopatch repeater for the members as a way of avoiding cell phone charges, then it is an abomination.

One reason for closing a repeater is to prevent it being taken over by the long winded old geezers talking about their latest operation. One reason for an open repeater is to welcome new people and new ideas. I don't have a hard and fast answer to this question. I think it depends on local conditions.

OK, fine.

Let's take the repeater I operate on - private, in the sense that you are asked not to use it unless you've been approved by the trustee. Since it's not open, the coordinator decides to tell him to either open it up or get off the air. I can tell you what Jim's reaction would be: he'd tell the coordination body to go to hell, and leave it on anyway. The coordinator could not force him to shut it down. If they tried to coordinate another repeater on the same channel, Jim would sue so fast your head would swim - because the rules were changed in midstream. Why should a coordinator invite a lawsuit in today's litigation-happy society?

I'll take your complaints a lot more seriously when you sit in the hot seat for a while. You won't get your teeth kicked in if your ideas are implemented; I will.

Jordan Kossack, KOSSACKB@RICEVM1.RICE.EDU, writes;
<...After all, their income taxes are even higher than here in the States...>
Wrong. Our base rate is 25% and the top rate is 40%.

<...I never understood how the VAT (Value Added Tax) adds value to an object. Sure, it increases the retail price...>
Just like purchase taxes do.

Phil Howard, phil@ux1.cso.uiuc.edu, says;
<...Aunt Margaret wants her cut in EVERY STEP OF THE WAY...>
It's got naff all to do with "Aunt Margaret". VAT was introduced to harmonise with the rest of Europe, all of whom have VAT. We used to have "Purchase Tax", which was levied at point of sale, just like the USA. Except we didn't have the dumb system of quoting retail prices without the tax.

Anyway, the difference in prices of R1s has got nothing to do with taxation. VAT is 15%, so it can't account for a price difference of over 100%. It's got more to do with (i) greed, (ii) exchange rates, (iii) size of market & (iv) greed.

I agree. Further, I must take part of the blame; this kind of thing has
bothered me before, but I haven't spoken up about it. Even more, this is
one convention where I have some input, since it's also the summer
meeting of the Texas VHF-FM Society, and I currently serve as its
president.

I'll print a copy of your posting, and pass it along to the convention
organizers.

Re: Awarding DX certificates for contacts during specific time periods

Given the nature of DXing, I don't think it would work to restrict contacts to certain dates. A better choice would be to restrict the bands that DX awards are issued for. For example, restricting to 160, 80 and 20 would clear up the other bands a bit for these alleged DX stations who are afraid to operate otherwise. (No particular reason for picking those bands, other than 20 which is pretty much wholly-owned by DXers anyway.)

It's also probably wise to consider that if the pileups are horrendous now, when DXing is a 24-hour/365 day pursuit, the result of compressing the pileups will be pretty ugly (especially for the "DX Derringers" who have to wait for the big guys to get their fill at the trough before they can get a chance.)

>out of N6's; so what's next?

On the same note, in 2 land the extra calls are getting
close to WZ2Z. What comes after that? I may be taking the
test next week (if I can nail down all those element numbers
and space rules :-) and want to figure out whether to go
for a new call.

Apparently they went from our own WZ2B to somewhere around "P" between
may and july 1. If I pass the test on Aug 11 I assume the issuance
date would be somewhere in mid September? If there is no "summer
surge" then it will be a close call whether I get into the Wx2x calls.

I realize that some of the newsgroups I've specified are not precisely
appropriate, however I felt they were the ones most likely to be read
by someone who could answer my question.

I would like to know of any radio frequencies used by airshow and demonstration
teams.

Of particular interest are the USAF Thunderbirds, the USN Blue Angels,
the US Army Golden Knights, the Christen Eagles, Team America, The French
Connection, The Red Baron Squadron.

Any others that you might know are also very welcome.
Tower frequencies or Airshow coordination frequencies are likewise welcome.

We are planning to video tape some airshows, and would like to patch in the
plane to plane audio and record it when we can.

THANK you all very much!!

> area.

This brings up another point about reliability. When the cell site
does go down (granting that it may normally be more reliable than
typical amateur installations, it still can fail) you are out of business
within most of that cell. Amateurs, on the other hand, can usually
find another repeater to use when the one they are using quits.
(Of course, this indicates that cellular is more spectrum efficient
in the normal course of events. But spectrun efficiency isn't
everything.)

phil@ux1.cso.uiuc.edu writes:
>However if it does turn out they delete the cellular frequencies then
>I will certainly fuss, complain, and raise hell, and encourage everyone
>else to do the same.

Did I miss something? I originally heard that the problem was a
patent dispute involving some kind of scan mode or something really
stupid like that. Later I read (in 73 or QST or something) that it
wasn't that at all but rather just production delays and marketing
decisions. They can't keep up with the S series transcievers yet
so they decided not to gear up on the R-1 yet. Nothing at all having
to do with cellular.

My IC-24AT allows me to enter frequencies in the cellular band when I
enable extended receive, but claims that the synthesizer won't lock up
in that range. Since it locks up solidly just above this, in the 902MHz
band, I wonder if it's just lying to me and was programmed not to allow
reception at these frequencies by faking an unlocked synthesizer.

I think that your 24 may be slightly frobbed. Mine is stable up to
about 940. Even there is recieves, just the `U' blinks on and off.

On a similar note: has anyone got the out of band TX mods to work?
We couldn't get it to go with the Icom mods.

Thanks and 73s, jv

> for a new call.
>

Well, people in 4 and 6 land have had to deal with that now for a while.
When the 1x2 and 2x1 calls are gone from the extra group, you will get a
2x2 call starting with AA. Here in 4, we are up to AC4xx in the extra
groups, and are almost out of tech/general calls (we are in N4Zxx, and
close to N4ZZZ). Heck, the novice calls have gone thru most of the
KC4xxx calls!

Personally, I would hate an AC4xx call, so when I get my extra (not IF,
but WHEN...), I'm keeping my call and I'm gonna look for a job where
there are 1x2/2x1 calls left!

Not to bring up a old topic, but it is getting almost necessary for the
FCC to recover old calls and reissue. I'm not saying that I like the
idea, but there may not be very many other choices left.

Sure Was, I work for Cellular One in Florida. We are owned by McCaw
communications in Seattle (IF you noticed my id). Under a hurricane for
Florida or an earthquake for Calif, you know people want to know whats
going on. AT&T was busy to the point they didn't try to charge for some
of the long distance as everyone was calling in and out to see if Aunt
June has crushed by a brick wall or the 880 interstate.

>1) If one is making a call from a cellphone to another cellphone in

> places to fail; probably more than if the call went twisted
> pair the whole way.

Guess again, What do you think twisted pair does??? Wake up! We send the
call to the hub that is closest to the exchange. Thats why if I call a
West Palm Beach number from Miami, its thru our network, not the local
Bell company. SO, if Ma Bell can't get you thru, we might be able to.

> If the cell hub CO goes down (or the uwave dish is thrown out
> of aim), all the users of that whole system are out of luck.
> If a cell site fails or loses a tower, you'd have to find a
> working cell somehow and hope it wasn't swamped.

If the uwave dish is thrown out, its got to kill both dishs. If Both are
out, we attempt physical dial backup. If the whole tower is shot, there
is not much standing in the area to help anyhow. Think about it. You best
believe California is going have laws to ensure proper installation, that
includes earthquakes (Florida, its flooding / Hurricane wind forces!)

>2) There are two cellular providers in the bay area, as for other
(Cellular One and most likely Bell)
> places too. I have heard (from someone whose job is to care about

> building in Oakland, and the other is in a liquefaction zone
> somewhere else in the east bay, from what I understand.

That may just be one switch in the network. The network is designed to allow more that one switch to fail. I will admit we take every step to keep the switches up and running. The Fort Lauderdale switch has Battery backup for over 8 hours and a generator (with fuel to run 1 week continuously) in case Florida Power and Light becomes unavailable.
I am fairly sure that the sites in Calif have similar setups as we are both owned and operated the same way.

>3) As has been pointed out before, these people are not in the game

> earthquake-tolerant cell phone system qualify for this? Probably
> not for a big shaker, I would guess.

Building an Earthquake-tolerant cell site would be important. We would want to protect our equipment, don't you? ;-) Now as to the PROFIT:

<FLAME ON> Hey, Last time I checked we where all in the HUMAN race, You may not qualify! But I KNOW and HAVE SEEN this company go out of its way to help the community. If a major emergency hits, we will do everything we can to help, ITS OUR HOME! You best believe that I will be on the Ham bands relaying messages AND using the cellular phone to get supplies for the local hospital or what ever service I can be to this area. I know that others in the company who would be giving blood, driving supplies, etc... You have a LOT of nerve saying we are in it for PROFIT, especially during life threating emergencies. BTW HP is not exactly a "NON-PROFIT" group according to the news today in the stock market section. <Flame off>

From: dale@crg2.uucp
Message-ID: <39884@sequent.UUCP>
Source record: 9584

I have a question about charging ni-cad batteries. I built an external power-pack that holds 8 D sized nicads wired in series. To charge I can pull them all out and drop them in my charger which happens to hold 8 cells. I'm wondering if I could simplify things by charging though the plug I have on the battery pack. These cells are Panasonic bought in bulk at a local discount store. Label says charge at 80-100 mA for 16 hours. I'm using a Panasonic Model BQ-8B charger right now. Any simple alternates to charge this -- Without resorting to computer control as in QST? I'm happy to wait 16 hours. Can I use some inexpensive pwr supply such as I might have sitting in junk box?

(Sorry if this was covered in the previous ni-cad discussions. I was on vacation and had quite a few hundred articles backlogged and some also expired from our machine.)

I'd like to find out if anybody on INFO-HAMS has done business directly with amateur radio firms in Great Britain? Back in April I joined the Radio Society of Great Britain (RSGB) while at the Dayton Hamvention, and finally started getting the monthly magazine "Radio Communication".

I'm having a good time, seeing the difference in the types of articles; the `demise-of-Ham-Radio-Magazine', and `changes-at-73-Magazine' discussions, here on INFO-HAMS, have made interesting reading, with `Radio Communication' as a comparison.

Well, like any ham, I started going through the advertisements, to see how they differed. In general, I'm seeing the same Japanese ham gear as we see in the magazines here in the states. There do seem to be a few more small/specialized operations advertising in `Radio Communication' (QRP & CW interest there seems more obvious). I was pleased to see (being a `true believer') that Tentec seems to have good visibility over in England.

Now I've got a `problem'; there are one or two British firms that I'm a bit interested in perhaps buying something from and, I'm in the situation of never having tried to buy something directly from overseas.

I've written letters (with SASE's, or SAE's as they call them, along with IRC's), and am waiting to see what kind of response I get.

I've talked with the local (Dallas area) U.S. Customs people, to see how Customs Duties might affect the final price of something. For amateur radio gear, it doesn't sound as though there's going to be very much of a problem. I'm hoping that the British firms will have had enough dealings with hams overseas, so that they'll know how to conduct business with somebody in the U.S.

I'm less sure of how to handle the money situation. When I joined the RSGB at Dayton, they just took my personal check, and did whatever had to be done to keep their accountants happy. I've talked to my bank, and it turns-out that they have a branch in England but, they want a ten-dollar charge to generate a Bank Draft or, THIRTY DOLLARS to wire money to England. Good golly ... I'm looking at buying a CW key that will cost (maybe) $40 - $50; a $10 charge on top of that would be unreasonable.

I'm curious as to how to go about buying some British stamps? Sending IRC's (to try and ensure a response about a product brochure) is rather expensive. The local (Dallas) British Consulate was kind enough to give me the postal rates, for airmailing letters from Britain to the U.S. and, it's about the same as going from the U.S. to Britain. Most of the

British firms ask for 3 IRC's from overseas hams, for return postage; at 95 cents for each one, that adds-up really fast. I figure it'd be cheaper just to send some British stamps along with my requests, as long as I can buy them for not too much of a mark-up over their face value.

So, if anyone `out-there' has experience in doing business with Britain, I'd like to hear about how it's done.

Thanks,

Paul Nix (WB5AGF) InterNet: nix%muppet.decnet@consrt.rok.com

Many British firms take credit cards (including the RSGB!). Access = Mastercard, Visa is the same. The credit card companies do the conversion at a "wholesale" rate, which is better than you can get at the bank.

For transactions where credit cards don't work, I have used Pound Sterling traveler's checks. You can get American Express versions of these at many banks. I haven't seen denominations less than 10 pounds, but I use these for such purposes as paying my G-QRP club dues (which are 5 pounds; I send in dues for a friend as well.) You could ask for a credit voucher or extra goodies instead of change, or just write off any overage.

In article <RJY&V2#@splut.conmicro.com> jay@splut.conmicro.com (Jay "you ignorant splut!" Maynard) writes:
]In article <1990Aug1.213344.1217@bellcore-2.bellcore.com> karn@thumper.bellcore.com writes:
]>Yes and no. Yes, a closed repeater is the property of its owner and he
]>doesn't have to let anyone use it. On the other hand, the channel on
]>which it operates is NOT his property, and he has no right to deny
]>it to others who would operate an open repeater on it.
]
]OK, fine.
]
]Let's take the repeater I operate on - private, in the sense that you
]are asked not to use it unless you've been approved by the trustee.
]Since it's not open, the coordinator decides to tell him to either open
]it up or get off the air. I can tell you what Jim's reaction would be:
]he'd tell the coordination body to go to hell, and leave it on anyway.
]The coordinator could not force him to shut it down. If they tried to
]coordinate another repeater on the same channel, Jim would sue so fast
]your head would swim - because the rules were changed in midstream. Why
]should a coordinator invite a lawsuit in today's litigation-happy
]society?
FLAME ON
Sounds like Jim is hardly a credit to amateur radio, if he is willing
to sue a volunteer over a hobby related manner! Who is this guy, anyway?
What's his frequency, so I can use it for simplex operation next time
I'm in the area?

What makes him think he has exclusive claim to a frequency? What gives
him that right? And, don't tell me that stuff about his expensive
equipment, etc. The frequency, a limited natural resource,
is the issue!
FLAME OFF

He may tell the coordinator to go to hell, and leave it on. That's
his priviledge. However, once he is de-coordinated he no longer
can claim interference if someone "unauthorized" is using his
input frequency.

]
]I'll take your complaints a lot more seriously when you sit in the hot
]seat for a while. You won't get your teeth kicked in if your ideas are
]implemented; I will.
Having been involved in coordination for ten years, including a very
nasty repeater war, I think I qualify for "hot seat." I still think
that coordinators are doing a disservice when they coordinate

closed repeaters in a crowded band. By the way, I proposed at
the repeater owners meeting here in AZ (which is also the coordination
council) that they no longer coordinate closed repeaters. My motion failed
about 60/40, due to the large number of closed repeater owners voting.

I've bought things other than radio equipment from Great Britain. I've always just used my Visa card and let Visa fight with the exchange rate question. From what I've seen on my bills, the exchange rate is quite good considering the small size of the transaction. (There doesn't appear to be a flat conversion fee in it either.)

>The only reason to change would be to get a shorter call.
>(And I can't think of anything to do with KC6LZF)
>Any ideas?
>
>Thanx,
>Jim KC6LZF

I heard a guy on 10 meters the other night with N6ZZS. They're gone for sure. I asked a similar question back in March. I called the FCC and was told that when the N6xxx calls were gone that Novice, Tech and General callsigns would *ALL* be KC6xxx. I studied hard and passed my tests at the end of March. I was KC6KFX and now N6ZEK. (as an aside, I almost got N6ZED - This is "N" "6" "ZED" - a 1x1?)

The FCC did say that if you wanted they would issue another KC6xxx call or you could keep KC6LZF.

Good luck on Saturday!

| It probably won't simplify things since recording CSCE data like this is
| a new and different procedure they've never done before. It would probably
| be best to just have a distince class.
+---------------

Phil, what is the practical difference between the suggestion above and the
current situation when a person upgrades but keeps his old call sign? Whether
it's called a "class" or an "accreditation" or etc. doesn't much matter.

One thing to do is to use your Visa or Mastercharge card for purchases. The conversion is done by the card company, and there's no surcharge that I see. This works to other countries, also.

>is really just a spread spectrum modulator with a 1:1 spreading ratio.)
>Therefore no additional steps are needed to eliminate spectral lines (other
>than picking a long enough shift register).

This is quite true. We used a simple 15 tap shift register to generate a
2^15-1 sequence of data bits that were XOR'ed with the digital data in a
TDMA transmitter. It spread the data out quite excellently, except when we
accidentally fed it a correlated input (correlation meaning we fed it the
same 2^15-1 sequence as data that it was using to scramble. The data was
just shifted in time due to delays incurred in the signal path). The
receive side used the same PN sequence generator and both were started at
a known point in the data stream. It turns out that if you are transmitting
continuously with 'random' data (like voice), the scramblers can be set up
to lock together quite easily within a short period of time. Assuming the
data rate is high enough, it takes just a couple of seconds to do this. Then
again, we were using 8 mbit/sec data streams, so things just work faster...
A simple tapped shift register works quite well for evenly spreading the
frequency spectrum of just about any signal you want to send. Synchronizing
the receiving PN scrambler to the incoming data can be tricky, but is doable.

Over the years of interacting with the female species I have attended many functions whose attendees were mainly female: craft shows, lectures, a local discussion group meeting, etc. They didn't even try to have anything that might have interested husbands/significant others. While the terminology used (ladies) may have been offensive (although I find being called gentleman more amusing than offensive), and the choice of activities may not have been very interesting to some (but given the average age of hams and their spouses I don't know), the fact that hamfests try to have alternative activities for those (usually female) people who are unfortunate to have to accompany their ham spousal-like unit (usually male) doesn't seem worthy of indignation to me.

By the way, are the terms "lady" and "girl" verboten or are their age ranges where their use is acceptable? At my company (mainly male engineers) we have become sensitized to not calling female co-workers girls, since we certainly wouldn't call each other boys, and I don't think anyone under the age of 50 calls anyone "lady", but some older women seem to like to be called girls and very young girls seem to like to be called ladies. I guess eventually all gender distinction in our language may disappear and the announcement at the ham fest will say:
ATTENTION, HUMANS, IN 5 MINUTES THE ALTERNATE ACTIVITIES
FOR NON-RADIO NERDS WILL START IN ROOM 123. WELDING, OIRGAMI,
ORIGAMI, MAKING LITTLE THINGS OUT OF STUFF YOU WOULD NORMALLY
THROW AWAY, HUNTING, CONVERSING MEANINGFULLY, AND THE WET
SOCK COMPETITION WILL BE HELD. FOR THE YOUNGER FAMILIAL UNITS,
A NEW VIDEO ON THE DANGERS OF DWARF TOSSING (RECENTLY OUTLAWED
IN NEW YORK) WILL BE FOLLOWED BY THE RELEASE OF HUNDREDS OF
BIO-DEGRADABLE DIAPERS, WHICH CAN BE SAFELY EATEN BY SEA TURTLES.

Hmmmm, maybe all this will put a stop to the practice of DX stations saying: "The YL only, go ahead." My throat is still sore from the S2 operation.

The BBC and Deutsche Welle have a shared relay base in Antigua, which is all of about 30 minutes from St. Maarten by air. You should have absolutely no trouble hearing them whenever they are on the air. The BBC World Service is relayed from Antigua on 5975 kHz in the (local) late afternoons and evenings; the Deutsche Welle German service is on 6100 in the (local) evenings - sorry that I don't recall the frequency used by the relay station for the Engish programs, but it shouldn't be hard to find.

As a die-hard Caribbean-o-phile (to be accurate, a die-hard Windward-Islands-o-phile), permit me to make one suggestion: if you are at *all* into SWBC DXing, do plan on spending some time DXing South and Central America from the eastern Caribbean. Even in the summer, despite the static, the props are at least halfway decent, and you'll have no trouble hearing at least 10 stations on 90 meters at any time between dusk and dawn.

When DXing from the Windwards I tend to use Radio Nacional de Paraguay on 9735 kHz as my propagation beacon for 31 meters. If its coming in *really * well (it comes in at least O.K. even during most of the daylight hours), I start hunting for exotic stuff from the "southern cone" of South America. Admittedly the Windwards are 300+ miles south of St. Maarten, but on the whole my suggestion applies equally as well to the Leewards such as St. Maarten -- I know, its worked for me pretty well from St. Kitts & Nevis.

You will have little trouble logging a decent number of Peruvians and Bolivians on 90 and 60. For me, bagging these stations gave me the most pleasure. They are REAL DX targets, and that Andean music is unbelievably haunting and beautiful.

My beacon for Central America on 90 is TGNA, "Radio Cultural" on 3300 kHz, from Guatemala City; for 60 I tend to use HRVC, "La Voz Evangelica de Honduras" on 4820 kHz from Tegucigalpa.

Lastly, the number of Venezuelans and Columbians - particularly on 60 are astounding. I'm not much of a Brazilian DXer, so I can't say much about how the DX is from that country -- on the other hand, I can't imagine that its much "worse" than from the rest of South America; the only drawback is that you'll have to get youself up and out of bed a litte earlier. :-)

Have fun and 73.

I just bought a new Kenwood TS-940S. The manual says that the
fan on the heatsink on the back will hardly ever come on during "normal"
use. The manual further says that the fan will cycle on and off during
operation. My fan is off when I first power up the radio, but once it comes
on, it stays on. This occurs even if the transmitter is never used, and I stay
in receive mode. The heat sink itself stays warm, even with the fan running.
Is this *normal* ? I can't ever say that I've seen it cycle on and off.
Do I have a problem, or is this the way they all work?

Close but no cigar Pete.

You want to leave the stub OPEN at the end so the other end looks like
a short at the required frequency. Also you want to DIVIDE by the velocity
factor the free space quarter wavelength to get cable length.

>pointing out, you need a large amount of isolation.

Wait! Of that +50dbm of ERP, how much is out-of-band? My impression
of SS is that we are required to keep intentional radiation inside
the band. Therefore the only power that can pass into the out-of-
band narrow receiver is that small percentage of the total transmit
power contained in spurious responses that happen to be within the
passband of the narrow (20khz) receiver. Therefore simply subtracting
and getting -50dbm doesn't seem to be valid.

Also SS on 2m? I guess I need to reread the rules, I thought SS
had to be 420Mhz and above.

>]desense or intermod to the narrowband equipment. We did wind up

Reread what I said. We added a cavity later because the narrowband
equipment was bothering us; not the other way round. I agree that
real wide spread spectrum should have even better characteristics.

> experienced yet... :-)

The key is in the rythm. With a hand key it becomes obvious;

daahdi dahdahdahdahdaah dahdaah dididaahdit didahdaaah

The extended final dashes in a character along with the occasional staccato dots are the characteristic of what was commonly known as the "Lake Erie Swing". The "Bannana Boat Roll" tends to accent the individual characters in a pattern similar to the poets iambic meter. Both of these "swings" are much easier with a "sidewinder" or "sideswiper" key. These keys are constructed to be actuated with a horizontal motion, you form the dots manually as there is no vibrator element. Elements are formed (keyed) on alternating sides as opposed to the "VIBROPLEX" style "BUG" which forms dots on one side and you form the dashes on the other. Many OTs just clamped a hacksaw blade to a vertical support, wrapped friction tape on the free end and mounted a couple of screws to allow contact on either side of the blade. This is a fine way to do it but there is often too much flex in the arm of the key. A stiffer saw blade or some small angle stock attached to the length of the blade makes for a better feel. This type of key is excellent for mobile CW work; it is a more natural movement than that from a straight key and doesn't take the concentration of a "BUG" or an electronic keyer. For those of you who may wish to buy such a beast you might see if INSO Electronic Products is still in buisness. They are the successor to Bunnell and (in 1975) still had a stock of "Sidewinders". They are/were located on Long Island.

Like I said, try it neat, there's a lot of potential in that call.

>that hard to control.

A savvy operator can usually control a pileup. What we're talking about is the guy who's just getting on HF after getting his HF license in one of the "rare" countries. He can be literally driven from the band by DXers. And being in a "rare" country, almost by definition there is nobody he can turn to for advice on how to handle the situation. So he leaves ham radio with a bad taste in his mouth and a distorted picture of hordes of wealthy people from industrialized countries screaming at him from powerful stations for the sole purpose of exchanging a meaningless number and a callsign. Then months, even years later, he receives tons of mail demanding that he send expensive replies. There is little wonder then that, at the next WARC when he is representing his country as one of the few electronic experts they have, he will turn a jaundiced eye toward the amateur spectrum.

>Another point that needs to be made is that the US isn't even close

Just because we aren't alone in being obnoxious boors doesn't mean we are right. Look, I'm not saying DX contesting is wrong. I'm just saying that a 24hr a day, 7 day a week, 52 week a year, all band contest is harmful to amateur radio. I think it's way past time that the contest sponsors rethink the whole deal.

Everyone seems to be tip-toeing around this, so maybe I'll address it directly: How about a "computer class"? This would be for everyone who wants to use radio as just a link between their computers and who would like to avoid the use of hard lines. The exams would exclude any kind of Morse Code and would have no analog technical questions. Maybe we could set it up so that it is "Amateur Computing Communications", completely separate from ham radio; with some band space of its own that excludes CW, AM, SSB, and FM or any other form of voice communication. It could even have its own counter-part to the ARRL: The ARCL. What about it?

I own up to the initial comment here and though I may have sounded
bitter in my initial posting let me now expand and answer some of the
follow on talk.

In article <9007260548.AA16565@tecnet1.jcte.jcs.mil>, mgb@TECNET1.JCTE.JCS.MIL writes:
> >> I don't know about the rest of you but I would prefer not messing up
> >> my back yard! I know all the flames that this comment will generate
>
> >OK, let's get down to the nitty gritty here....
> >
> > I **DO** want them in MY backyard !!

I do not want them (communicators) on 2 meters, or any lower band for that
matter. Maybe I did not make my initial message clear; 2 meters, like 20, IS
in many areas of the country, a zoo, one that I would not like a newcommer to
experiance. There is a lot of hype about 2 meters being "THE BAND". Why,
because thats where most of the "OLD PHARTS" have invested in repeaters and
ancilliary equipment. Yes, there are other activities on 144-148 but the
weak signal types etc are pretty tollerant of problems and quickly jump to
help solve them for the novice. (not required to be a Novice) There is just
too much going on on 2 meters to let a horde of newcommers enter with little
more in mind than bear reports and ratchet jawing. (Face it, you will get
a good number of technical persons and a lot of those who really want to be
HAMS but the number of CBers will far and away be the majority.) Keep the
Communicators off 2 meters.

> >
> >And because of the fact that I live in a rural-like area, my backyard is
> >stuck at being 2 meters.

With an easier to obtain licence open to 220 voice you will gain a new
backyard. If they can't get on 144-148 then if they want to talk they will
use 220 which, for this purpose, is just as good.

>
> Ok Phil.. let's for a moment suppose that the Novice License is saved. Where
> THEN is the central meeting ground for ALL of HAM RADIO? Hint... Novices
> already have 220 privileges. We need to populate 220.... and it has

>
> and we also put links on it to 2 meters
> so that we had the OPTION to hook into it and talk to them, just like we
> all have the OPTION to operate Novices on the HF allocated areas. I
>

When are we ALL going to get over the stigma that Novices and Communicators are not HAMS? I may have been bad mouthing one segment of the proposed Communicator population but I have no intention of declaring them anything other than HAMS and treating those who wish to support and defend our precepts of creation as such.

> >> but just consider that for all practical purposes, there is NO difference
> >> between 146, 222 and 440. They are ALL relativly local in coverage
> >> (on average), they ALL have relativly simple equipment requirements
> >> and they ALL have resident hams within easy distance over most of the
> >> country. Where they are different is that more people are needed
>
> >About HALF of the country.
>
> And whose fault is that?
>

For the purposes that Communicators will use these frequencies: datacom, TV, experimenting and just plain communicating on a (relativly) local scale, these frequencies are, on AVERAGE, identical!!!

> >BUT if Communicators do NOT get on 2 meters, then you will be getting what
> >you say, because the Communicators in the rural areas will be getting NO
> >(usable) privileges.

Communicators in rural areas will have useable privileges by the fact that there will be other Communicators in the same rural areas, your point assumes that only a very small group of these people will appear in rural areas. After things have reached a stable state following the inception of the licence class then we should see more activity and a usable 220 band in rural areas.

>
> >> one smacks of slum-lord tactics, later on the slum lord gets the

> >> and erecting "AFFORDABLE" housing (with HUD money). Did any one
> >> ask the slum lord who would be able to "afford" the housing?
>
> >Make a point, please.

I guess I shouldn't have been so metaphorical in my position on this one. What I was saying is: if you have a resource which is not in a viable posture and you wish to convert it to a model application you can do one of two things. First, you could tear it down, remove it from its current use immediately or, second, you could allow the current users to render it useless and then condemn the resource and take over by right of eminent domain. If you are smart, you even make a profit doing this and get acknowledged as a hero. Now what I am saying in context of amateur radio is this: either dismantel the entire service and get a black eye doing it or let the amateurs destroy the service and then take the frequencies and SELL them to broadcasters, cell-phone and other services. So, let's not chose a path which will be self destructive in the end, loose if we will, let's just put up a fight and make sure the villian is identified as someone else.

> >band, then the "Elmer" can also buy a new UHF radio to talk to him, or
> >leave him alone.
>
> EXACTLY! I like the last option. If elmer wants to help him he can buy
> a 220 Mhz radio and do so, or your repeater group can FUND a 220 repeater
> and help NOVICES too.

And, isn't this the true Ham Elmer spirit? When did you expect your kid to buy a car before you taught him how to drive? You taught him in your car or you got him to driving school.

Well, I guess I did generate a lot of bandwidth with that posting. I apologize for being so tangential in my initial statments. Remember, there is a difference between a novice and a Novice, they are not required to be the same person. Similarly, Novices and Communicators will all be HAMS, so let's treat them like HAMS. Teach them something and they may teach you something, if not technical then possibly behavorial.

Unfortunately it is not your right, the FCC calls it intentional
interference if there is a conversation going on thru the repeater
at the time. It has always been considered bad amateur practice
to operate simplex on a repeater input frequency whether the repeater
is open or closed or even if there is no local repeater at all.

> structured?

I disagree. I think making contact with all points on the globe is a
novel enough achievement that people will pursue it whether or not
any recognition is involved. Worldwide communication is one of the
gee-whiz aspects of amateur radio.

Furthermore, why does the DXCC program need justification? It's just
a paper chase. If Wayne doesn't like it, he can start his own (I think
he has.) In fact, anyone can have an awards program. I simply don't
believe the DXCC program is the cause of poor operating practices.

> And before you answer, have you listened in on 20 on a regular
> basis, and thought what it would be like to be on the other end of some of
> these pileups EACH AND EVERY TIME you got on the air?

No I haven't thought what it would be like because this is not the way
things work. My experience has shown that the station being called
dictates (through his operating practice) 90% of the behavior of the
stations calling (aka "the pack"). If the DX station makes a big
deal out of himself, he will whip the pack into a frenzy. On the other
hand, if the DX operator plays wanders up to 14345 and plays it low key,
he can have a few nice conversations without being hounded by the pack.

>Pontus Hedman rph@sq.com {uunet|utzoo}!sq!rph

LORAN-C receivers use "voltage probe" antennas (very high impedance, allowing them to be short). The whip is usually connected directly to a FET gate, perhaps protected by internal diodes, also a neon lamp to ground. They occasionally get knocked out by lightning. I have one on the back end of my car, and a 5/8-wave 2m antenna on the front, with 45 watts. That doesn't seem to bother the LORAN, but I don't think I would want to run 100 watts PEP HF six feet away.

My Micrologic ML-5000 LORAN receiver has given 8 years of very reliable service. I once visited th 400kW LORAN station in Indiana. A mile away, I turned off the receiver and unscrewed the antenna, just to be sure. (The receiver was then only 1 week old, so I was more paranoid than now. :-)

Could it? Doesn't the cellular system still depend on Ma Bell's phone lines
for any calls outside a cell? The phone system nearly always overloads
in any widespread emergency, and adding the capacity to handle this would
be EXTREMELY expensive.

I have never heard of channel capacity being a problem on repeaters during emergencies. We have over 100 repeater/simplex channels on 2 meters alone, and most repeater groups are more than willing to vacate a repeater for use in a true emergency.

Of course, 20 meters is another story -- one or two anonymous jammers can wreak havoc. But even here, the problem is not channel capacity.

>of the Ham activities, either, either as far as I can tell. Lighten up!

I interpreted the flyer the same way Derek did: that the organizers expected all the women attending the show to be more interested in fingernail polish than ham radio. That's not just "providing activities for ladies who choose not to be hams"; it's providing only certain *kinds* of activities. And it makes me gag, too.

I should state up front that in many cases, the organizers are probably correct in assuming that this is the kind of activity non-ham wives want to attend. It pains me to admit that, but having inadvertantly wandered into a jewelry demonstration at a ham convention once, it appears to be true.

However, I believe that any convention group that offers only such activities is selling everyone short. How about a forum for non-ham spouses of hams introducing them to the hobby? I think I saw such a meeting advertised at one convention. Some conventions even offer one-weekend ham classes, with Novice testing at the end.

Okay, so not every non-ham spouse will want to attend a radio forum. There must be unique cultural or historical features of any city that an out-of-town visitor would like to see; why not arrange tours to these? Heck, I'd gladly skip an antenna forum to attend a taping of "Austin City Limits." :-)

>No one is trying to keep lady Hams out
>of the Ham activities, either, as far as I can tell. Lighten up!

From what Jon Covington said, some convention organizers *do* seem to feel that "ALL ladies" would rather play bingo than attend radio forums. Derek isn't imagining that this attitude exists.

>We are in the 20th century, Derek, so let's not forge into the 21st making
>believe there is only one sex.

That's not what Derek said at all. He was simply requesting acknowledgment from ham convention organizers that not all women these days want to attend makeup and jewelry demonstrations.

A related incident: a female ham friend of mine who's very active in emergency communications was asked to speak at the YLRL (Young Ladies' Radio League) forum at a convention a couple of years ago. She reported

to me later that the members' favorite activity was making little gifts
for each other--potholders, jewelry, stuff like that.

I am *not* criticizing the women who enjoy this; it's thoughtful and
undoubtedly gives them a feeling of satisfaction and friendship. **But
it isn't the sort of activity that grabs the souls of businesswomen
like Susan and me.** I think that's the point Derek was trying to make:
yes, there are women (especially non-hams) who enjoy the kinds of
activities the Austin convention was offering them. But there are lots
(perhaps the 30s-40s crowd who have their own careers) who would prefer
a broader and more intellectual choice of alternative activities.

I think Fred is on the right track, trying to do something about the
incentive licensing scheme, but I think there are a few adjustments to be
made.

Trading frequency for power, well, I don't thing very many people will buy
this. Also, allowing 5wpm people in the current general and advanced space
will not be accepted by the world community unless we can get all of them
to change.

No, I think something like what is used in Europe would be better:
With a few ammendments.

There should be 3 classes(for now)
1) A little HF bandspace, a little VFH bandspace, and not a very hard test.
like the current novice, but without the code.

2) VFH - all VFH privelages
3)) HF - all HF privelages -(must know 13wpm code)

2 and 3 could be merged in a few years.
Yeah, I know this will get rid of some of the Extra Bandspace, but this will push organizations to do proper band planning. Frankly, there is no reason why there has to be a law that only extra's can be in the extra space. It should be that that space should be allocated for high speed CW traffic, whoever wan'ts to use it.

Just some food for thought

I have gotten the impression (from somewheres) that if you join one repeater group that runs an open machine, that you don't need to join (ie, fund) other machines that you might occasionally use. And that your group lets other people from other repeater clubs use yours.

I suppose after a beginner finds out about the above (if true), he'll settle onto a favorite repeater, and eventually join its club. Guess the same thing holds for packet; I joined (or sent money to) the group that runs my home BBS (KD6TH, RATS). I do more packet than talking, anyway.

dube@cpdvax.csc.ti.com responds to my posting as follows:

>>What's with Derek Wills? Can't ladies be ladies? Can't they be recognized
>>as such? I see absolutely nothing chauvinistic in providing activities for
>>ladies who choose not to be Hams! No one is trying to keep lady Hams out
>>of the Ham activities, either, either as far as I can tell. Lighten up!
>>There ought to be room for everyone at the Austin Hamfest.

>>73, Dube N5PDK

Perhaps I didn't make myself clear. What I was objecting to was the clear inference that if you are at a hamfest you are either (a) a ham, or (b) a woman. I further objected to the fact that the only activities for the women involved personal adornment and 'crafts', and that these were alternatives to 'staying at home"..

Am I so unusual in knowing women who are hams and whose husbands are not? Were I a non-ham husband of a ham, I don't think I'd want to attend sessions on face-painting and fingernail preservation. I've never organized a hamfest (and have never attended one), but aren't there ever sessions on "how to become a ham" or "what hamming is about", which ham spouses could go to in order to find out what all the spousal excitement is about? Why not tours of the city (there are plenty of places in and around Austin)? My wife has an astronomy Ph.D., and if I suggested that she accompany me to the hamfest and attend the beauty sessions I'd be in REAL trouble :-) OK, so you don't schedule sessions on the latest in astrophysics, but you don't go to the other extreme and assume that women spend all their time at home or in the beauty parlor.

I do, however, agree with Dube's last line (above) - "There ought to be room for everyone...." That's what I was trying to say.

]>on the input frequency, using the repeater's PL, that is my right!
]
]John, surely you don't mean to claim a right to maliciously interfere
]with other amateurs...but that's exactly what that claim amounts to.

You're right, Jay, I don't mean to claim that right. Look up the definition of malicious interference sometime. In general (ignoring the FCC's toothless statements about repeater coordination), the rule on a frequency is first-come, first-serve on a per-QSO basis. So, if a private repeater is not in use, and I strike up a conversation on its input with someone else, I am not in violation of ANY FCC rules. Now, let's say someone comes along and wants to use the repeater, so they get on and start talking. THEY are guilty of interference.

NO ONE is guilty of malicious interference unless they intend to interfere with a conversation. Malicous interference requires INTENT. Believe me, having been involved in the successful prosecution of 2 cases of malicious interference, I know that you need to show intent in order make the charges stick.

So... having demolished malicious interference... lets consider other FCC rules. The FCC has said that interference to a coordinated repeater has primacy over other users of its frequency pair. That means that if a repeater is coordinated, and you do what I described, AND it causes interference, the FCC might go after you for "good amateur practice" violations. If the repeater is un-coordinated, they would go after the repeater USER, rather than those who were already engaged in conversation on its input.

Now... I'm not going to go around talking on closed repeater inputs in AZ - there are plenty of other frequencies to use. If their weren't, however, I suspect that the closed repeaters would lose their coordination. In that case, I would use their inputs for simplex.

Washington, D. C. 20554

In the matter of)
)
Amendment of Part 97 of the) PR Docket 90-55
Commission's Rules Concerning)
the Establishment of a Codeless)
Class of Amateur Operator License)

To: The Commission

COMMENTS OF BRIAN KANTOR
August 1, 1990

Summary

The author believes that the Commission's proposal for a codeless Communicator class of Amateur Radio license is an excellent idea and will be instrumental in generating new interest in Amateur Radio. It has long been apparent that the Morse code requirement for any class of Amateur license has been a barrier to the entry of many otherwise qualified people into the Amateur radio service. Since Morse code is rarely used in VHF and UHF communications, there does not need to be an examination requirement for a license that would permit operation only above 30 MHz.

However, the author strongly disagrees with the proposal to exile these new codeless-class licensees solely to frequencies above 220 MHz, and instead believes that it would be to the greater benefit of the people of the United States and the Amateur service to allow these licensees all amateur privileges above 30 MHz.

Further, the author feels that the Commission's desire to simplify the Amateur licensing structure is a good idea, but believes that the Commission's proposal to eliminate the ``lower'' grades of license is the wrong approach as it will discourage the entry of new hams into the Amateur radio service.

Discussion

Advancing the USA's technological leadership

In today's technologically competitive environment, anything we can do to encourage interest in scientific and technical fields can only be to the benefit of all the citizens of the United States. I feel that the proposed no-code license will further this goal, since it will encourage many young people to enter a technologically-demanding hobby, and may well influence their choice of career in favor of engineering and scientific work. At a time when surveys show a greater-than-ever decline in scientific knowledge and interest among high school and college students as well as the public at large, it makes good political and business sense to encourage our citizens to pursue those interests that placed America in the position of world leadership that it now enjoys.

Many of the other nations of the world have codeless amateur radio licenses. In fact, few countries which permit amateur radio do not have some class of codeless ham license. In effect, the US requirement that all ham radio licensees learn and demonstrate Morse code proficiency is losing our country the competitive advantage of encouraging the technological progress of many qualified citizens through their participation in the amateur radio service.

Morse Code is a barrier

The requirement of learning to send and receive Morse code is often mentioned as the one entry barrier by many technically-inclined individuals who would otherwise have become ham radio operators. These people do not believe that their time would be well-spent in learning a largely useless ``skill'' that is of no practical application in modern communications. They (perhaps rightly) view learning the Morse code as a kind of ``hazing'' they would have to pass in order to join the fraternity of Amateur radio operators.

Therefore, the elimination of what many consider an obsolete and superfluous requirement for entry into the ranks of Amateur radio would clearly be to the benefit to the Amateur service as a whole, since interested people will now be able to join in. Some of these will already be technically advanced in the electronics and radio arts. Others will be beginners who will learn from their ham radio experiences. Many of both groups will contribute to the advancement of the radio and electronics arts.

The Need for Morse Code Proficiency

It is clear that in today's advanced radio environment, digital and voice modes have supplanted all but a tiny amount of Morse code communications.

It is no longer necessary for a competent radio operator to know Morse code; Morse is rarely used outside of the amateur radio service. Much of the non-ham Morse is mechanically sent and received using automatic equipment, so that the operator really does not need to have a knowledge of Morse. Indeed, many ham radio operators use such mechanical devices instead of manual methods to send and receive Morse. Thus a ham license which has no Morse code requirement will still promote a reserve of trained radio operators.

Morse code is rarely used in VHF and UHF communications, and while it is often heard on the HF Amateur bands, it is only one of many modes in use there. Although Morse is popular among a subset of hams proud of their skill, a great majority of amateur communications are by voice, with the use of digital communications methods (such as packet radio) increasing by leaps and bounds. Even the traditional advantage of Morse for weak-signal communications no longer holds true: digital signal processing techniques have yielded communications systems which can be built by the ham experimenter that will provide reliable communications at received signal strengths far below those at which the human ear can even discern that there is a Morse signal present.

The argument has been advanced by some that the Morse requirement serves as a useful ``filter'' to keep out the less-disciplined or ``rabble'' elements. That is clearly not true. In countries around the world, there are many codeless amateur radio licensees, and yet no higher percentage of rules violations seem attributable to these operators. Additionally, one need only look at the few ``bad apples'' currently to be found among the amateur ranks; it is notable that these seem to be roughly evenly spread among those of all license classes, even those with the higher grades of amateur license which have more difficult Morse code requirements. Clearly the existing Morse requirement has not filtered out the few undesireables.

I do not believe we will see an influx of hooligans as a result of establishing a non-code class of ham license, since there will still be an examination that a prospective licensee must pass to demonstrate his knowledge of regulations, operating procedure, and technical knowledge.

But Morse code does have a place in the tradition of amateur radio. I do not propose at all that the Commission ban Morse code. Undoubtedly those who are interested in preserving this nearly-obsolete mode of communication will acquire the skill and equipment, and keep Morse alive, much as the current fans of AM do. The ability to send and receive Morse code is, after all, a skill that one can be proud of. I merely maintain that, because of its

irrelevance to much of modern Amateur practice, it is not a skill that need be required of all licensees.

Against segregation of licensees

Some have suggested that Communicator Class licensees not be given the privilege of operating the six- and two-meter amateur bands. This smacks of a segregation akin to that of the suburb dweller who allows that it is ok for a member of a minority to be given equal housing privileges as long as it isn't in his neighborhood.

Unfortunately, for as long as international treaty and regulations require, it is necessary that a codeless class of amateur license must be restricted to the amateur bands above 30 MHz. However, I can see no merit in the proposed restriction of Communicator Class licensees from using the six- and two-meter amateur bands. While it is true that these are popular bands, and although these bands are quite busy in many larger communities (with thousands of amateurs making daily usage of hundreds of repeaters and other modes), these bands can accomodate more hams.

If the Commission's vision is to introduce the Communicator class of license as a steppingstone to more advanced ham licenses, it makes very little sense to segregate the newcomers from the experienced amateurs. These new licensees could learn much of the traditions and skills of amateur radio from experienced hams; keeping them apart would prevent this valuable interaction from occurring.

The most recent advances in Amateur radio technology are in the areas of digital communications and satellites. Many of the people working in these areas do not hold the higher classes of amateur license; in fact, a very large number of them (such as myself) hold the Technician class of license - the very minimum license we could get to allow us to pursue what we were interested in doing. I believe that many who will take advantage of the proposed no-code license will participate in the same ways, and it makes little sense to keep them apart.

Simplification of the Amateur License Structure

The Commission has expressed a desire to combine existing license classes and the proposed Communicator class licenses as a means to avoid further complexity in the multiple tiers of amateur licensing. I believe that this goal is a good one, but that this is not the best way to achieve it. Rather, I feel that eliminating the ``entry level'' licenses would work against the best interests of the amateur radio service. Although not perhaps the subject of

this rulemaking, such a simplification has been brought up by the Commission as part of the Communicator class proposal, and I would like to submit to the Commission the following thoughts on a simplified license structure.

I suggest that Amateur radio licensing should be simplified to just three classes of license: Novice, Technician, and General.

The Novice license would be retained in its present form as an entry point to the Amateur service. The 5 wpm telegraphy, rules, and basic theory and practice examination would remain essentially the same. The license would grant the same privileges as the existing Novice class license.

The Technician license would have a more extensive theory and practice examination, equivalent to the existing Technician/General class license, but would have no Morse code telegraphy requirement. It would grant all amateur privileges above 30 MHz, and to encourage Technician class licensees to advance the next grade of license, all Novice class telegraphy privileges. Essentially, this is the existing Technician class license with no telegraphy examination.

The General license would include the Novice telegraphy test and the Technician rules, procedure, and technical examination requirements, and would grant all amateur privileges in all bands.

Incentive Licensing has been counterproductive

The ``Incentive Licensing'' scheme inspired by the ARRL and established by the Commission many years ago was in many ways an experiment to improve the quality of Amateur licensees by rewarding them with additional privileges. In a large part this experiment has not proved successful, primarily because the path of advancement of amateur radio has primarily been the VHF bands (and above) where the additional privileges to be gained by earning a higher class of license were minimal at best. (The argument has been put forth that the reason that this advancement of the state of the art took place at VHF and above was because of the restrictions cause by incentive licensing, but that is unprovable, however likely.)

Thus incentive licensing has not succeeded in its stated goal of advancing the state of the art of amateur radio. During its tenure, we have seen an ever-aging ham population shrink as fewer young people were inducted into the Amateur service. Much of this may be due to the fact that a major portion of the advancement to a higher grade of

license was tied to a increasingly less-relevant Morse code requirement.

Many amateurs have expressed the thought that incentive licensing was a mistake and that it is time to abolish it. Although the ARRL, which represents a large portion of the US amateur community, has yet to take an official position on the matter, many ARRL members and directors have personally expressed the opinion that pushing for incentive licensing was one of the biggest mistakes the ARRL ever made.

Certificates of Proficiency

It is clear that many people have obtained higher grades of Amateur license because of the satisfaction that earning certifications of advanced knowledge and skills can bring. Currently the ARRL issues certificates of Morse code proficiency at levels beyond those of Commission regulated licenses, and many amateurs have taken and been awarded these honors.

I believe that voluntary organizations like the ARRL could offer examinations covering advanced technical topics and other skills, and issue certificates of achievement to those demonstrating their abilities. Far more than a few grades of license, these could examine and certify people in a variety of topics and levels of skill, and would further Amateur Radio as a self-regulating service, as well as greatly reducing the amount of administrative work the Commission would have to perform. These non-regulatory certificates of achievement would reward those hams who have demonstrated above-average skills far better than a few kilohertz of ``restricted neighborhoods'' can.

Conclusion

Thus I believe that the Commission should establish a class of Amateur license with no Morse code examination, a technical, procedural, and regulations examination equivalent to that of existing Technician or General class of licenses, and that such a license should grant all Amateur operating privileges in all Amateur bands above 30 MHz.

Further, I believe that the Commission should, perhaps in a separate action, simplify the existing license structure by combining the existing Technician, General, Advanced and Extra Class licenses into the General class of license with a minimal Morse code requirement (as required by international treaty). The Novice class of license should be retained as a beginner's entry point into Amateur Radio.

I believe that these changes will foster the growth of Amateur radio and that in turn will provide direct and indirect benefits to all the citizens of the United States.

Author's qualifications

I has been involved in radio more than twenty years, and have held a Technician class amateur license since 1971. I have been the licensee of several remote controlled, auxiliary, and repeater stations, the trustee of a ham club station. I held a First-Class Radiotelephone license, with Ship Radar Endorsement, and currently hold a General Radiotelephone License (again, with Ship Radar endorsement), as well as other Commission-issued licenses and permits.

I am interested in amateur radio digital communications and networking, have presented papers at the ARRL computer networking conference, and am the author of DARPA networking standards. I have built many amateur repeater systems, including several using microprocessor control; worked as a commercial radio service technician and systems engineer, radio station and television studio engineer; and am employed as a senior systems analyst at the University of California San Diego Network Operations group. I am currently researching basic radio networking, including the use of store-and-forward messaging systems as a means to improve the capability of amateur radio to provide communications in times of need.

I have no business or other pecuniary interest in amateur radio.

Thank you for your consideration of these comments.

Respectfully,

Brian Kantor

I recently passed my novice and Tech test (haven't recieved them yet).
I purchased a Ten Tex Omni-D and have been listening to you all talk.
I would like to find mods for this rig, even though I wouldn't use them for
a while. I have the 10mhz transmit and WARC transmit mods from Ten Tec,
(Ten Tec IS as good at customer service as you have heard). Any mods,
or war stories would be appreciated. The rig seems to receive fine, and
all the built in filters are terrific (especially the CW ones) but I think
it could use some help in the SSB audio department. Anyone have any nice
audio filter/speaker projects that might help me out ?

Thanks
Don Peacock

> chatting (repeater users, not operators -- my "owner" meant "licensee
> of"). It picks up packet. It picks up most SSB. It intentionally
> leaves out "weak signal" and especially "moonbounce". Both of those
> tend to use high power, and both tend to be done on CW! (Weak signal
> terrestrial is often SSB, but serious weak signal work often falls back
> to CW.)

But a lot DOES exist on SSB. And a lot of the CW, ESPECIALLY THE MOONBOUNCE
is done quite SLOW. You could be looking it up on a Morse Code chart.

> For 5 WPM, you get a somewhat higher power limit on VHF/UHF; I didn't
> mean to limit Generals to Novice levels. (Except maybe on HF, where
> Novice power is a-plenty!) I suppose some moonbouncers may not be
> good at CW, but how big a problem will that really be? In the interest
> of simplicity, of course, I don't want to add a super-VHF license.
>
> Very few hams need more than a hundred watts or so on VHF. BTW, I don't
> have a problem going to 10 or 25 watts on 1240 and up, from the current
> novice 5 watts, since reality says we have to match Japanese radios and
> not the other way around.

But the original issue with regard to the CW exam is the fact that it is
just not "relevant" and should not be used, except for getting access to
HF (due to international agreements) and maybe also for accessing some
small high speed CW subbands with a higher speed exam.

I agree that few hams need more that 100 watts or so of power, but for
those that do, the relevant exam needs to be directed at what one needs
to know to deal with the high power properly, not the kind of operation
most happen to choose to do with activities that usually also require
high power.

```

If it's NOT called a class, it won't fit into the FCC computer. But the FCC will still have to keep a record of it. If it doesn't fit into their system now, they have to modify it or add a new system. That option appears to be not available. But since they have to do the work to record the data anyway it might as well just be called a class (maximum of 6 of them) and fit into the present system and that be that.

```

I agree.

All that needs to be tested on is ENOUGH competence to properly operate on the radio frequencies as authorized, NO MORE. That DOES include things like preventing RFI (because you have your choice of frequency, power, and emission mode, which other service operators rarely have), personal safety, and of course the rules and regulations.

For instance you do NOT need to know Morse Code to avoid being a nuisance on the CW subbands; you only need to know that if you don't know code, you should not be there.

F L A M E W A R N I N G

now's your chance to skip

last chance !!

> Let's take the repeater I operate on - private, in the sense that you
> are asked not to use it unless you've been approved by the trustee.
> Since it's not open, the coordinator decides to tell him to either open
> it up or get off the air. I can tell you what Jim's reaction would be:
> he'd tell the coordination body to go to hell, and leave it on anyway.

Jim who? It would be time NOW!! to petition the FCC for new rules to
allow coordinators to pull his ticket!! Actually, I'm not that serious
about the rules, but this Jim character sounds like #1 A**hole.

> The coordinator could not force him to shut it down. If they tried to
> coordinate another repeater on the same channel, Jim would sue so fast
> your head would swim - because the rules were changed in midstream. Why
> should a coordinator invite a lawsuit in today's litigation-happy
> society?

Now we *KNOW* this Jim is an A**hole (if he sued).

First of all no rules were changed in midstream because no rules exist.
Sure, the coordinators have policies, but these are NOT legally binding
and have no importance to the courts. Out goes sick Jim's one argument.

There is a definite problem in our society of people being all to happy
to sue. I would expect the coordinator to (and if it were me, definitely
would) counter-sue. While the law suit would be a major hassle for both
parties, I know which way it would ultimately go.

> I'll take your complaints a lot more seriously when you sit in the hot
> seat for a while. You won't get your teeth kicked in if your ideas are
> implemented; I will.

Perhaps we should just up and sue Jim for wasting spectrum and causing
the loss of 220-222 Mhz. At the current rate of value I'd estimate we
could ask for about 4 billion dollars. But all we'd probably get to
walk away with is his house and (now un)coordinated repeater.

It's a**holes like Jim that are CAUSING the coordination mess. These guys
need to be shutdown, and quickly, before we all get shutdown for lack of
any spectrum.

Is Jim gonna sue the FCC for loss of 220-222 Mhz?

> by the long winded old geezers talking about their latest operation.
> One reason for an open repeater is to welcome new people and new
> ideas. I don't have a hard and fast answer to this question. I think
> it depends on local conditions.

While I think this is a valid case for a closed repeater, as I don't particularly care to hear about what's gonna happen when I get older, I must defend the old geezer's right to use whatever frequency he wants to use as long as doing so does not interfere with other radio operations.

But the interpretation a lot of people (repeater owners) are making of a coordination is of being the "owner" of the frequency in that location, and that just is not so, even if the coordinators are saying so. The coordinators that are saying so probably deserve to be sued, as they have no authority to grant ownership of a frequency.

If coordinators, repeater owners, and others, did a BETTER job of working out the problems with coordinated repeaters, then there would be enough repeater frequency pairs to satisfy all the needs amateur radio has. As it is now, they are not doing enough. There are many reasons for this, from threatened law suits, to conflict of interest. Some coordinators try, and run into problems with others. Some coordinators just don't care to.

In the major metropolitan areas, even the UHF TV band is "full". Of course "fullness" here means just tight enough for **CHEAP** TV receivers to be barely able to slice apart the stations (30 Mhz of empty space between co-located stations). This is a HORRIBLE waste of spectrum just to save $10 per receiver.

UHF stations should be able to operate much closer and even ADJACENT.

But what is really sad is that VHF and UHF TV is a primarily FIXED point-to-multipoint service, which is more suitable to spectrum above 2 to 4 Ghz. FM radio broadcasting still tends to be mobile enough that it should not have to move up there. The appropriate usage for spectrum in the 30-3000 Mhz range is mostly mobile.

Just think of what land mobile could do with 42 Mhz of VHF high band divided into 8400 5 khz channels and 336 Mhz of UHF divided into 13440 25 khz channels (or 16800 20 khz) and trunked. I'd suggest 76-88 be used to expand FM broadcasting, and 54-72 could have many other uses.

We just need to find a place to put broadcast TV way up there.
I would certainly urge that HDTV *NOT* be allowed below 2 Ghz.

|> Sounds like Jim is hardly a credit to amateur radio, if he is willing
|> to sue a volunteer over a hobby related manner! Who is this guy, anyway?

John,

You have to realize that the "we can't change anything, we'd get sued"
line is basically nothing more than a cop-out. Anybody can sue anyone
for any reason at any time in this country. It doesn't mean a judge
will agree with their grievance.

This excuse is unfortunately quite prevalent among frequency
coordinators. Some time ago I got into a discussion with one of the
local council members. I asked how the remaining part of the 220 band
would be divvied up if/when we end up losing 220-222 MHz. I added that
I thought the only fair way to do it would be to take away 40% of the
repeater band, 40% of the simplex band, 40% of the packet band, etc.
(This is a subject of considerable interest to me since I operate
56kb/s packet on 220.55.)

His response was "we can't tell any of the repeater owners in 222-225
to move! They'd sue us!" My response: "How do you know *I* won't sue
you?" I said it with a smile, but I think he got the message. He
didn't have an answer to that.

In the matter of)
)
Amendment of Part 97 of the) PR Docket 90-55
Commission's Rules Concerning)
the Establishment of a Codeless)
Class of Amateur Operator License)

To: The Commission

COMMENTS OF PHILIP R. KARN, KA9Q

Summary

Amateur Radio's most important role is to interest young people in science and technology and to encourage them to pursue careers in the field. It once did this admirably. But amateur radio has not kept up with the times, and it is faltering. The average US amateur is now over 50 years old, growth is stagnant, and the code requirement is to blame.

A codeless amateur radio license is long overdue and must be created without delay. Furthermore, it must grant full amateur privileges above 30 MHz. It should not be seen merely as an "entry class" amateur license, with holders still expected to learn the code before they can become "real" amateurs.

Code proficiency is no more relevant to operation on the 50 and 144 MHz bands than it is on the frequencies above 220 MHz. Furthermore, access to the 144 MHz band in particular is absolutely essential if the Communicator license is to attract newcomers and integrate them into the mainstream of amateur radio.

The Novice license should be retained. I agree with the Commission that there are too many license classes, but this issue should be addressed in a separate proceeding by proposing that the _t_o_p (rather than the bottom) of the Incentive Licensing "ladder" be dismantled.

August 3, 1990

- 2 -

The Code Requirement Is Killing Amateur Radio

1. The debate over the codeless license is really a debate over the fundamental purpose of the Amateur Service. I think the existing Section 97.1, Basis and Purpose, is exceptionally well written and has withstood the test of time. Its authors knew that rapid technological progress characterizes this field, so they wisely avoided mentioning any particular radio communications technology such as Morse Code. Instead, they used phrases such as "advancing skills" and "advancement of the radio art" to state clearly that amateur radio was expected to keep up with the times.

2. In its earliest days, Morse Code was essential to the Amateur Service and a code proficiency requirement was then necessary and proper. But that era was long ago. For many decades individuals without any knowledge of the code could have made valuable contributions to the Basis and Purpose of the Amateur Service. Unfortunately, the code requirement remained long after the reason for its existence had vanished. Today it protects only the parochial interests of those already licensed, not the broader interests of the public that entrusts valuable spectrum to the Amateur Service.

3. The intense debate over the codeless license prompted many amateurs, including me, to think long and hard about a realistic future role and raison d'etre for amateur radio in a world where spectrum, like land, is scarce and getting scarcer. Some stubbornly refuse to accept that we do not own our spectrum and that we must continually earn our allocations. Others agree that we must "pay our bills," but disagree on the best way to do so.

4. Much of my support for a codeless license comes from my own strong interest in technical development and the desire to attract more technically oriented people to the service. But I know that this alone is not enough. Most of today's technical innovations come from corporate and government research labs, not from radio amateurs; we hams simply don't have the resources to compete. Nor can amateur radio's much-touted emergency service role alone justify its allocations much longer, given the rapid deployment of cellular radio systems that have placed millions of telephones in the hands of motorists almost everywhere. In short, few if any of its specific technical or operating activities will be able to sustain amateur radio forever.

5. There is one role, however, that can easily justify the existence of amateur radio well into the future. I speak of its remarkable ability to interest young people in science and technology and to give them a ready outlet to express and develop that interest. Many technical profes-

sionals, including myself, were originally introduced as

August 3, 1990

- 3 -

youngsters to electronics and communications technology through amateur radio. It played a large part in encouraging many of us to pursue careers in the field. And our professions benefit everyone, not just those who are licensed amateurs.

6. This unique role makes amateur radio a valuable national resource. It justifies the allocation of precious spectrum that some argue be reallocated to serve the public's needs more directly. But young people are an even more precious resource than RF spectrum. At an age when many of my peers were still trying to figure out what to do with their lives, I knew what I wanted to do with mine -- thanks to amateur radio.

7. Today, however, amateur radio no longer attracts nearly as many young people. One oft-cited reason is the personal computer, a communications tool _p_a_r _e_x_c_e_l_l_e_n_c_e that, unlike amateur radio, requires no operator license and no code test. (Indeed, I discovered computers in 1972, less than a year after my introduction to amateur radio. If computers had come first, I might never have bothered to learn the code and become an amateur.) Another reason amateur radio no longer attracts young people is the widespread (and, I think, mostly accurate) image of radio amateurs as reactionary old men whose staunch defense of an irrelevant code requirement epitomizes everything that is wrong with amateur radio. Amateur radio should be an investment in the future, but it is now a monument to the past. And creative and talented young people are always much more interested in future possibilities than in old monuments. The codeless license is therefore absolutely essential if amateur radio is to justify its existence.

A Codeless License is Absolutely Necessary to Attract Technical Contributors

8. In my profession I regularly meet many highly qualified technically oriented people that I believe would be an asset to amateur radio. I often try to interest them in the more advanced areas such as packet radio and satellites. And in almost every case, the initial fascination quickly dissipates when I get to the "fine print" -- that knowledge of Morse Code is still required by every class of US amateur license.

9. I long ago stopped counting how many times this happened. To non-amateurs in my profession, amateur radio is a relic of a bygone era. I try to explain that amateur radio includes small, progressive groups such as TAPR and AMSAT who do their best to promote new ideas and technology. Unfortunately, getting this message across is a frustrating, uphill battle.

August 3, 1990

- 4 -

10. This is made all the more difficult by an indefensible code requirement. Creativity, originality and insight are uniquely human traits vital to technical innovation, and people with these traits often have a strong, built-in drive to express them. Give them an outlet, and they'll prove they're far from lazy. (Why else do so many computer hobbyists write elaborate computer programs only to give them away?) But require these people to learn the Morse Code, and you'll often run into a brick wall.

11. The problem is that for those who will never use it, learning the Morse Code is a pointless exercise in rote memorization. There's no room for creativity, and this deeply offends many of the same people amateur radio needs the most. This is especially true for young people to whom the technical side of amateur radio could be an excellent outlet for interests that are all too often frustrated in the classroom. There's already way too much rote learning in our educational system, and far too little emphasis on developing the innate creativity and capacity for original thinking in almost every young person. It is utterly tragic that amateur radio has fallen into the same trap of mediocrity.

12. Technically oriented amateurs are a dying breed in US amateur radio. The most technically oriented American amateur radio magazine, _H_a_m _R_a_d_i_o, recently ceased publication. The mainstream amateur publications in several other countries, such as _C_Q _D_L in West Germany and _C_Q _H_a_m _R_a_d_i_o in
Japan, are much more technically oriented than their US counterpart, _Q_S_T. (I note in passing that both West Germany and Japan have popular no-code licenses.) The ARRL does publish a thin technically oriented newsletter, _Q_E_X, but its circulation is small. A relative handful of highly dedicated "hard core tekkies," running on the edge of personal burnout, is responsible for virtually every recent amateur packet radio and satellite development. And just our present projects could easily keep us busy for a lifetime.

13. We desperately need an influx of new technical contributors to help share the load and to form "critical

masses" around new projects. Being surrounded by professional colleagues, some of whom would be significant contributors to amateur radio were it not for the code requirement, makes it all the more painful. It's like being stranded in a life raft: water, water everywhere, but not a drop to drink.

The Codeless License Should Grant Full Privileges Above 30 MHz

14. The Communicator proposal is a step in the right direction, but it does not go far enough. Since the only difference between the Communicator and Technician licenses would be a code test, there is simply no rational

justification for excluding Communicators from the 50 and 144 MHz bands or for limiting transmitter powers to 200 watts.

15. Besides its basic unfairness, limiting Communicators to frequencies above 220 MHz would have many serious drawbacks. The most important is the lessening of the appeal of the Communicator license to prospective amateurs, particularly in the less densely populated areas of the country where the higher frequency bands are lightly used. A related problem is the reduced opportunity for contact between Communicators and existing amateurs. Given the widely understood importance of quickly assimilating the newcomers into the mainstream of the amateur service, creating a "ghetto" for the Communicators is most unwise.

16. Given the rarity of Morse Code on the bands above 30 MHz, a Communicator who will have passed a written test more comprehensive than that taken by present Technicians will be no less capable of fulfilling the basis and purpose of the Amateur Service. I therefore utterly reject the notion of such a license as merely an "entry class" license, or of considering its holders as anything less than "real" amateurs. If this influx of new amateurs causes congestion on the 144 MHz band in some densely populated areas, so be it. Although I believe this risk to be vastly overstated, the worst that could happen is that all users of the band, not just the Communicators, would be motivated to use the higher frequency bands and to improve on their spectrum management techniques.

If The License Structure Is Too Big, Simplify It - But Keep The Novice

17. The Commission says that its staff cannot process more than 50,000 amateur license applications per year. This

probably explains the Commission's proposal to do away with the Novice and Technician classes when the Communicator is created.

18. I am sympathetic to this problem. The US already has more examination elements and license classes than any other country. Recent budgetary pressures have undoubtedly made the overhead of this unwieldy system intolerable. Dismantling the cumbersome and largely ineffective Incentive Licensing system adopted in 1968 would free processing capacity that would be better used to handle Communicator applications.

19. However, the Commission proposes to begin dismantling the Incentive Licensing ladder at the wrong end. Even with the new Communicator, the Novice class would continue to serve a valid purpose as an entry level license for those interested primarily in HF operation. If the licensing

structure is to be simplified, then start at the upper end. For example, given ITU HF telegraphy requirements plus the continuing need for the Novice, as few as three classes could suffice:

Novice: Novice level written test, 5 wpm code test. Privileges identical to current Novice.

Communicator: Tech/General level written test, no code test. Full privileges above 30 MHz.

General: Tech/General level written test, 5 wpm code test. Full amateur privileges on all bands.

20. All existing licensees except Novice and Communicator would be grandfathered to General. Novices could upgrade to General by taking the written test, while a Communicator could upgrade by taking the code test. A similar structure exists in many other countries and works well.

21. Although such a major simplification of the licensing structure is most desirable, it is properly outside the scope of this proceeding. The preceding discussion was only to show one way that the Communicator could be created and the Novice retained without exceeding the Commission's application processing capacity.

22. So as not to delay the creation of the Communicator, I urge the Commission to create it in a "stand alone" action, without deleting the Novice or Technician classes. The Commission could then open a separate proceeding that

would simplify the entire license structure as just described. This could be done before the Commission's application processing capacity is exceeded by Communicator applications.

Conclusion

23. In conclusion, I urge the Commission to create the Communicator license and to give it full amateur privileges above 30 MHz. _A_n_y_o_n_e who can show himself qualified to pursue the Basis and Purpose of the Amateur Service -- and that most assuredly does _n_o_t require a knowledge of Morse code above 30 MHz -- must be allowed to enter.

24. I am well aware that merely creating the Communicator won't solve our problems overnight. For it to succeed, existing amateurs must welcome the new licensees and introduce them to a wide range of exciting and challenging activities. We will have our work cut out for us. My own specialty is the development of amateur radio computer networks (see Personal Background below). Several new amateurs have written me to say that my work in amateur TCP/IP

August 3, 1990

- 7 -

networking finally prompted them to become licensed. I take great pride in this, and I hope to succeed on a much larger scale with the help of the Communicator license.

Respectfully submitted,

Philip R. Karn, Jr., KA9Q

August 3, 1990

- 8 -

Personal Background

25. I am thirty-three years old, and have held an Extra Class amateur license since 1973. Professionally, I work in computer communications networking research for Bell Communications Research (Bellcore), the R&D consortium owned by the seven regional Bell companies. My formal education includes a BS in Electrical Engineering from Cornell University and a MS in Electrical Engineering (Computer Engineering) from Carnegie-Mellon University. My decision to pursue a technical career in communications had much to do with my exposure to amateur radio in high school.

26. Although I work professionally in the field, I retain a strong interest in advancing amateur radio technol-

ogy. I am a member of the ARRL Ad Hoc Committee on Digital Communications. In 1982 I participated in the design of the AX.25 amateur packet radio protocol. I have been a technical volunteer for the Radio Amateur Satellite Corporation (AMSAT) since 1980, where I have specialized in orbital analysis, and I currently sit on their Board of Directors. I also sit on the Board of Tucson Amateur Packet Radio (TAPR), the group that brought packet radio to the Amateur Service in its present form.

27. I am the coordinator and primary author of the KA9Q Network Operating System (NOS), a computer software package that implements the AX.25 and NET/ROM amateur radio networking protocols and the US Department of Defense (DoD) Standard Internet Protocol Suite ("TCP/IP") on a variety of personal computers. This software, including full source code (about 50,000 lines), is available without charge to any amateur radio or educational user. I estimate that there are at least 5,000 users of this software in several dozen countries. Although it was originally written for amateur packet radio, this software is also very popular with users of the National Science Foundation Research Internet (NSFNET). Some users have made significant contributions to the software even though they are not licensed amateurs. (I consider these people to be prime candidates for the Communicator license.) A significant performance enhancement I developed during my early experiments with TCP/IP on amateur packet radio was general enough to be made a required part of the TCP/IP specification. It is now used well beyond amateur radio.

28. I have written or co-authored over a dozen papers and articles on amateur packet radio and satellite topics that have appeared in the proceedings of the _A_M_S_A_T _S_a_t_e_l_l_i_t_e _S_y_m_p_o_s_i_u_m, the _A_R_R_L _C_o_m_p_u_t_e_r _N_e_t_w_o_r_k_i_n_g _C_o_n_f_e_r_e_n_c_e, the _I_E_E_E _J_o_u_r_n_a_l _o_n _S_e_l_e_c_t_e_d _A_r_e_a_s _i_n _C_o_m_m_u_n_i_c_a_t_i_o_n_s, and several other journals and magazines. I have given invited talks on and demonstrations of amateur packet radio and satellite technology to non-amateur technical audiences, including

INTEROP, a large trade convention devoted to computer internetworking, and various NSFNET groups, including the Internet Engineering Task Force (IETF, in which I participate professionally), and NORDUNET, the Scandinavian research computer network.

29. I have received awards and recognition for my work in amateur radio technology, including the AMSAT Technical Achievement Award in 1986, the Dayton Hamvention Special Achievement Award in 1989, and a "QST Profile" in the April 1990 issue of _Q_S_T.

Subject: SWL - Scanning Airshows

MONITORING AIR SHOWS

If you have ever been to an air show then you know the thrill of
excitement as the pilots show off there skills, but you could be
missing out on the ultimate thrill, that is actually monitoring
the pilots and all of the communications that go with what goes
on around an air show. The following frequencies have been
compiled from various sources including monitoring times and
popular communications, most all have been confirmed.

U.S.N. BLUE ANGELS: ground support 121.90
nbfm rpt. 142.025 in/out 142.625
common airshow 123.40
maintenance ch.10 143.60
air to air 241.40 250.80 251.60 275.35
360.40 384.40 395.90 391.90

U.S.A.F. THUNDERBIRDS operations 120.45
common airshow 123.40
air-air tactical 140.40 141.85
air to air 236.60
solo 5-6 236.55 241.40 273.50 283.50
team leader 250.85
air to air 294.70 322.30 322.60
air-air tactical 394.0 382.90
ground support nbfm 413.025

U.S.A. GOLDEN KNIGHTS operations 32.30
air coordination 123.40
primary 42.35

CANADIAN SNOWBIRDS ch.1 275.80 ch.2 295.60 ch.3 310.80
ch.4 227.60 ch.5 243.40 ch.6 240.50

ch.7 378.50 ch.8 266.30 ch.9 294.50
ch.10 322.80 ch.11 245.70 ch.12 316.50
ch.13 344.50 ch.14 356.60 ch.15 236.60
ch.16 283.90 ch.17 363.80 ch.18 289.40
ch.19 245.0 ch.20 239.80

NONMILITARY FLIGHT TEAMS common airshow 123.40 123.45
showtime control 126.40

Brazilian A.F. 130.55 130.655 132.25

Actually, in the Pacificon announcement, the activity "for the spouses" on Saturday is a shopping safari to San Francisco (from San Jose). Quotes from the flyer "Most of these stores seem to aim at the ladies, but there is shopping for men also."
"This is a repeat from last year by request of many of the gals"

BTW, Pacificon '90 is in San Jose on October 10-12.

>Commission's Rules Concerning)
>the Establishment of a Codeless)
>Class of Amateur Operator License)

My letter to the FCC was text set for a laser printer and is not easily posted (unless you read PostScript :-). The following are the pertinent paragraphs,

"... the author would like to express his sincere appreciation for, and his complete support of, the Commission's attempt to introduce a codeless class of Amateur Radio operator license.

"The author would, however, like to suggest that the new class of operators be given as many priviledges as the International regulations would allow.

"Specifically, if the codeless class were to be administered examinations on theory and rules and regulations commensurate to that administered to the Technician class operators, then there is little just reason why they should not be accorded the same rights and priviledges as a Technician class licensee in the Radio spectrum above 30 MHz.

"Further, the author would like to encourage the Commission to eliminate the separate classes of Amateur Radio licenses and perhaps reduce it to simply two classes -- a Codeless (above-30 MHz operations only) and a Code-proficient class (operations in all Amateur Radio bands), with the aim at consolidating to a single class of Amateur Radio operators when International regulations no longer requires Morse code proficiency."

End quote.

Flames to /dev/null or to the FCC, please.

What in the hell do the last 6 articles titled "Re: More ICOM IC-R1 Review" have in common?

Answer: Nothing to do with ICOM, scanners, the IC-R1 model, any of the problems or features of the IC-R1 unit, opinions, etc.....

Please title articles the same way the ingredient lists are drafted on most food products; whatever the most important(highest phyiscal content) first.

This thread should be:
1) moved to another newsgroup
2) retitled
3) referenced to all of the BS published less than three months ago in this newgroup (again the wrong place!!!)
4) ignored

Practice your usefulness and don't follow someone else's poor example with an even stupid'er act.

CW is absolutely NOT relevant to any non-CW operation so therefore a test
in it is just as irrelevant at any speed.

You happen to be interested in CW, and for you, it is a viable means of
communication. But I happen to NOT be interested in it and won't be
using it. I plan to work weak signal SSB soon, and do so NOW with FM
(yes, there is some of that, too).

There is also the concept of HARMFUL interference.

And the FCC policy applies to UNcoordinated repeaters vs coordinated repeaters. If you KNOW a repeater is on the frequency when you use its input or output for simplex, the situation is identical. It may or may not be a violation. I will have to think about that a while, but if you KNOW its there, you know its there.

Don--

Actually, I did consider that. I just didn't mention it in my posting
because I didn't want to dilute the main discussion about the apallingly
narrow range of activities for the group that makes up the bulk of non-hams
at ham conventions: namely, women.

I guess I assume that men attending ham conventions will be interested
in going to the forums even if they aren't hams. Is that a sexist
assumption? :-)

As for Doug Faunt's posting about Pacificon, yes, I saw that and noted
that the "shopping safari" will be visiting outlets for men's clothing
as well as women's. But Doug, would you like to place a bet on whether
any men will actually join the shopping trip? :-) I sure doubt it...

I have SM315.ZIP available on my landline BBS. That is the latest verison
that I am aware of. You can download this file by calling 317 882 9330 and
logging in as Ham Radio, use YAGI for the password.

If you can file request via Fidonet, file request SM315.ZIP from node
1:231/30, I support 12 thru 9600 HST speeds.

145. Radio Shack PRO-2006 scanner - product review

Newsgroup: rec.ham-radio
Date: 1990-08-05 06:13:24 UTC
From: parnass@cbnewse.att.com
Message-ID: <1990Aug5.061324.10795@cbnewse.att.com>
Source record: 9543
Cross-posted to: rec.radio.shortwave,rec.ham-radio

x-------------- CUT HERE ------------------------------------x

THE RADIO SHACK PRO-2006 PROGRAMMABLE SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-2006 is a 400 channel, wide coverage scanner radio, manufactured in Japan by General Research Electronics. It is the successor to the PRO-2005 and a grandchild of the PRO-2004, the super scanner which put Radio Shack out in front of its competition in the base station scanner market.1

The PRO-2006 is almost identical to the discontinued PRO-2005, with the exception that the PRO-2006 boasts HyperscanTM, a catchy way of saying that it scans fast -- about 26 channels/second versus the PRO-2005's 16 channels/second rate.2 At about $400, the PRO-2006 is $20 cheaper than the PRO-2005 was. Both scanners are built using surface mount components and are housed in a gray plastic cabinet.

Frequency Coverage

The PRO-2006 covers 25-520 and 760-1300 MHz, except for 2 gaps in the cellular telephone bands. The two gaps in the 800 MHz range can be restored all the Radio Shack continuous coverage scanners by removing a diode. Diode D502 is the culprit in the PRO-2005 and PRO-2006.

A matrix of diodes, attached to the microprocessor's input port, is often used to configure radios for sale in different markets. The diode matrix on new the PRO-2006 is located on the vertical circuit board just behind the front panel. There are 2 diodes present, and holes drilled for 2 more.

Lots of Memory

---

1. "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

2. "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast,

June 1989, and RCMA Journal, August 1989.

- 2 -

The PRO-2006 has the usual features that scanner buffs have come to expect: individual channel lockouts, selectable 2 second rescan delay, an external speaker jack, etc. Casual scanner users don't need 400 channels, but scanner hobbyists can have those channels filled up in no time flat, especially with frequencies in the vast 225-400 MHz military air band, and other federal government allocations.

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2006 memory is backed up by a conventional 9 volt alkaline battery (not supplied), which should be replaced every 6 months or so.

The 400 channels are divided into 10 banks of 40 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2006 maintains the handy feature introduced in the PRO-2004, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2006 is more flexible; any of the 400 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2006 has two scan speeds, which measured approximately 13 and 26 channels/second. While scanning at high speed, the PRO-2006 won't skip over weak signals like some of the AOR-2515 scanners do. Adding diode D501, situated at an unmarked location between D502 and D503 sped up the PRO-2005 scan and search rates by 25%. Adding the same diode in the PRO-2006 has no effect on the scan or search rates.

It has been claimed that a PRO-2005 could be made into a PRO-2006 by merely replacing the CPU clock crystal with one of a higher frequency. Don't believe it. Changing the PRO-2005 clock speed would affect both the rescan delay and the priority rate, and they would no longer be 2 seconds long, as they are in the PRO-2006.

When programming a channel, the PRO-2006 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overrid-

den easily, if need be, like to listen to a military mid-air refueling operation in the 225-400 MHz range, which is

mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2006 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any of the conventional 400 memory channels. One can set up several search pairs, for instance:

- 46.610 - 46.970 MHz: cordless telephones

- 144 - 148 MHz: the 2 meter ham band

- 418.625 - 418.900: Drug Enforcement Administration

Another unique feature of the better Radio Shack models is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 400 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 kHz, although the PRO-2006 is intelligent enough to select a default step size based on the frequencies being searched. As on the PRO-2004 and PRO-2005, there is a hidden step size of 30 kHz, but this step size is only used in the cellular phone band after restoring full 800 MHz coverage.

The selected parameters are displayed on the LCD panel, smaller than the panel in the PRO-2004.

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2006 searching upwards from 460.100. This is a nice feature.

The PRO-2006 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. Neither the PRO-2004 nor the PRO-2006 have this problem.

The PRO-2006 includes a SOUND SQUELCH, resembling the VSC circuit on the ICOM R-7000, which may be used during scan or search operations. With the the sound squelch enabled, signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals. This is handy for skipping over "birdies", link signals with a constant carrier, or baby monitors when baby is asleep.

The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2006 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that noisy dead carriers, digital data signals, and paging tones are worth monitoring and will stop the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. An audio filtering circuit rolls off the high frequency components before they reach the TAPE jack, which makes it impossible to use it for picking off FM subcarrier signals. In addition to a rear mounted external speaker jack, there is a miniature headphone jack on the front of the scanner.

The PRO-2006 lacks a COR (carrier operated relay) output, like ICOM R7000 and older Bearcat 300 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the PRO-2006 was compared with it's grandfather, the PRO-2004. Since a signal generator was not used, quantitative measurements could not be made. Instead, an Antenna Specialists AV-801 antenna was switched between radios, signals from stations were compared by ear, and the results tabulated.

Simply put, the PRO-2006 proved more sensitive than the PRO-2004 on all bands tested, and much more sensitive in the 850 MHz range. The earlier PRO-2005 was also more sensitive

than the PRO-2004, but both the PRO-2005 the PRO-2006 let 800 MHz trunked systems and cellular telephone conversations bleed through while searching the 118 - 132 MHz commercial aircraft band. The 800 MHz interference was heard on the 2005 and PRO-2006, not the 2004.

Although the PRO-2004, PRO-2005, and PRO-2006 can suffer the effects of intermodulation, they are much more immune than the overly sensitive, image laden Bearcat 800XLT. Intermodulation from paging appeared on several frequencies above 1000 MHz, in a region not many people monitor. Oddly, audio from television channel 50 was heard on 1251.625 MHz. The PRO-2006 has a 10 dB attenuator, operable by a slide switch on the rear. The attenuator helps eliminate intermod, but few people would want the attenuator enabled while scanning or searching as it degrades both wanted and unwanted signals. A programmable attenuator feature, selectable for each channel, would have been a better idea.

The up conversion design of both the ICOM R-7000 and Radio Shack PRO-2006 allows use of a very high IF (intermediate frequency), which helps avoid image problems.

The audio output quality is good, although the top mounted speaker directs the sound at the ceiling, but adding an optional external speaker allows the sound to be directed at the user's head.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a slightly different setting of the volume control, although this has improved over the PRO-2005. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2006 squelch control has a small amount of hysteresis, an improvement over its GRE ancestors. Too much hysteresis is like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching.

Mechanical and Electrical Construction

The newest scanners use tiny surface mount components, which permits manufacturers to cram more circuitry into smaller cabinets. This technology makes home repair and circuit modification almost impossible. The "lick and stick" parts are so small it's are difficult to tell a surface mount resistor from a capacitor, and components are rarely marked with their values.

The PRO-2006 is smaller and lighter than the 2004. It is enclosed in a gray plastic cabinet, with a plastic front panel. If one is going to pay $400, one deserves to own some metal, but several stages are internally shielded in their own metal compartments. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

The PRO-2006 vertical front panel is an advancement over the sloping panel of the 2004. You can stack the scanner on top of other equipment and see the controls without standing up. If sitting directly on a table, two hinged plastic feet, padded with rubber bumpers, can fold out from under the front of the radio to tilt it at a good viewing angle.

There is a single BNC antenna connector on the rear of the PRO-2006, and the radio is supplied with telescoping antenna which screws in through a hole in the top of the cabinet.

Internal construction is excellent, and the internal shielding is commendable. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies. The PRO-2006 owner's manual lists dozens of birdie frequencies. The shielding is much better in the PRO-2006 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a backlit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch. As with the PRO-2005, the poor contrast on the small LCD panel makes it difficult to read a frequency more than just a few feet away, and is nowhere near as good as the greenish blue fluorescent display in the old Bearcat 300.

However, physically challenged and vision impaired scanner buffs will appreciate the conventional raised rubber keyboard in the PRO-2006, Only moderate pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2006 is the right size to fit under the dashboard of intermediate sized cars, but there are few concessions to those wanting to use this scanner in a vehicle. Perhaps Radio Shack has been influenced by repressive laws restricting mobile scanners in a minority of states, like New Jersey.

Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items

were included with earlier, pre-PRO-2004 Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

Owner's Manual

The user manual is much better than the fold out sheet furnished with Uniden scanner.

A single page frequency allocations chart is included, but is very general. Trunked radio systems are mentioned, but only briefly. Most people buying PRO-2006s probably have other scanners and so will be somewhat familiar with scanning.

The up conversion design of the Radio Shack PRO-2004/5/6 allows use of a very high IF (intermediate frequency), which all but eliminates image problems. Ironically, the PRO-2006 owner's manual contains a section on images. This section appears in the manuals for most other Radio Shack models, and was thoughtlessly included in the PRO-2006 manual. It babbles on about images being 21.4 MHz away from the real frequency -- true for simpler models, but not so for the PRO-2006.

There is no schematic. Thankfully, detailed service manuals for Radio Shack scanners are usually available for $12.00 or so.

The PRO-2006 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2006? It would have been better to have more channel banks with fewer channels in each bank, say 20 banks of 20 channels. A "search and store" mode, like that on the ICOM R7000 and older Bearcat 250 would have been nice, and such a circuit is being marketed by Key Research. A lighted keyboard and a signal strength meter would also be welcome, as would a mobile mounting bracket and SCA output jack.

A frequency query facility, as found in the Uniden 200XLT, would have been very useful to finding in what memory channel a given frequency is stored.3 Mega-channel scanners

really need this feature and it would have been trivial to implement in the PRO-2006 firmware.

Summary - It's Tops

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2006. This scanner is the best base/mobile scanner available at time of writing. AOR's AR-2515 has more channels, but its buggy firmware and tendency to skip active channels prevent it from taking top honors. At about $400, the PRO-2006 scans much better than the ICOM R7000, a great VHF/UHF communications receiver, priced at over $1000.

The PRO-2006 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band and the newer federal law enforcement radio systems with their dozens of channels.

---

Quite right. I'm in San Diego. The co-ordination group here in SoCal
(SCRBBA) won't even respond to my request for co-ordination (RFC's). And
quite naturally, the current trustees of UHF repeaters don't want any data
published about their boxes. Check out the ARRL repeater directories over the
last few years. All very secret. SCRBBA will stack open machines 3 and 4
deep in SoCal but those with stroke (like SCRBBA insiders) have clear channel
boxes that only burp ocassionally. If it hadn't been for the 220 grab, you
would only see a half a dozen open UHF repeaters listed. Just tain't fair.
Kinda like professional politicians...

Gee, in a matter of days I'm now a "mysterious person"... :*<
Please see my finger.pln for complete address, phone number, and office hours..
No, I'm not in the Cornell area -- that's just how the mailer handles routing.
Actually, I live in Central Pennsylvania, and if I were to rely on you guys for
delivery of messages, you'd still be looking for me in the wrong State, having
missed me by a couple hundred miles, give or take a few... :*<

So, if I *don't* hear from you about my relative in SF, it could mean that:
1. you don't have any information about her
2. she is dead, but you chose not to pass the info along :*<
3. you can't find me

As for becoming a ham... I might... and I might even be able to convince my
cousin in SF... but, Old Auntie from across the bay...? Nah, don't think so.
However, if I were to use my ham license to get a personal message across,
wouldn't I be breaking the law? Wouldn't that be "circumventing a commercial
carrier"...? (Assuming, of course, that a commercial carrier were operational)
(Which has neither been proved or disproved)
(Which would require a bit more scientific approach to prove/disprove)
(Which can be a waste of time, since we'll always mix emotions with facts)
(Which is a shame, but then again, we're only humans... :*>)

Oh, the "free" service...
I'm kind of tired of hearing about a free service that:

1. I'm paying for.
Once again: there may be no out-of-pocket monetary transaction at the
time the service is rendered, but that's too limited an interpretation
of "free", in my opinion.
If a valuable limited commodity were not given to you for FREE (how do
you like that word now?), it could help reduce my phone bill, hence I'm
paying for your hobby through my phone bill. Come an emergency, you're
doing nothing, at best, but PAY BACK in the form of public service for
an exclusive privilege extended to you during normal times. I'll admit
that the concept is a bit more complex than that, but the *spirit* if
not the *letter* of this simple concept has not been disproved yet.
If it were, we'd have to conclude that there may indeed be a FREE LUNCH.
Of course the industry would have to pay for new frequency allocations,
but its customer base would also expand, and the *fixed* cost of some
items (towers) would now be divided by a greater number of customers,
eventually bringing costs down for everybody.
In any case, be it what it be, whenever the support base of any
commercial enterprise has been allowed to expand, costs have come down.

2. has a reliability level which is dubious to say the least.
More than ever now, I will stick to knowing that my relative is ok when

I *hear* her voice. (Go ahead, start laughing as I dial the number...)
Of course, there is always the PROFIT question... gee, and I thought
that was a *plus*... That tells me that the phone company will do all
they can to allow my call to go through... if it doesn't, they don't
collect. It's not in their best interest that I get a busy signal.
We've heard both extremes on this forum (phones were the first to
collapse... phones never failed...) and it doesn't really matter how
many more will add their personal experiences. What I know is that I
will stop short of nothing in order to hear her voice. I'm more than
willing to pay for the use of your equipment and your time, but you got
to find me first, then hand me the mike... deal?

3. can only be used in case of EMERGENCY.
Emergency - "an unforeseen combination of circumstances or the resulting
state that calls for immediate action."
(Webster's New Collegiate Dictionary, 1977.)
Unforeseen...? An earthquake in California, UNFORESEEN...???
A hurricane on the East Coast, UNFORESEEN...???
Come on, we may not know exactly where and when, but those events are
sure as h*ll to occur sooner or later... and with that degree of
predictability and a little planning... oh well...
Now, if we were talking about WW3... :*< :*< :*< :*< :*< :*< :*< :*<

Before the
Federal Communications Commission
Washington, D.C. 20554

In the Matter of
Amendment of Part 97 of the)
Commission's Rules Concerning) PR Docket No. 90-55
the Establishment of a Codeless)
Class of Amateur Operator License) Submitted: 23 July 1990

COMMENTS BY ROBERT J. CARPENTER, OF ROCKVILLE, MD.

MAJOR POINTS

1. There are flaws in the assumptions which have led the Commission to propose a no-code Communicator license class, and thus I oppose its creation. There are very strong reasons for retention of the Technician license. The Commission should cease issuing the General class license, since it differs little from the Advanced class and thus is a needless administrative burden. The Novice license should be retained, but in a five-year, non-renewable form. Finally, I point out serious flaws in the Communicator-with-Code concept, and offer suggestions on bands where the Communicator class should not be permitted, if it is established against my advice.

QUALIFICATIONS

2. I, Robert J. Carpenter, of 12708 Circle Drive, Rockville, MD 20850, have been a licensed amateur (W3OTC) since 1948, and holder of a Class A (now Advanced) class license since 1949. I am a graduate electrical engineer and have done engineering design work in the development of VHF/UHF ground-to-air digital communications (1951-53), radar map matching navigation (1953-55), VHF meteor-burst data communications systems (1955-59), portable atomic frequency standards (1959-63), VLF digital receivers and spherics direction finders (1970-75), local area computer packet networks (1975-84), and multiprocessor computer performance measurement (1984-90), including the detailed design of semicustom VLSI integrated circuits (1989-90). I was chief engineer of the first FM-stereo broadcasting station in the Washington, DC, area (WHFS), prepared the FCC application, built the transmitter, got it FCC-accepted, built the audio console, etc.

3. I have operated on all amateur radio bands from 3.5 to 450 MHz (except the "WARC" bands), using many operating modes. I specialize in VHF and UHF, particularly the 50 MHz band using SSB and CW. I assembled a 146-MHz FM repeater for AMSAT in the Washington, DC, area, and maintained it for a few years (1972-5). I was one end of the first amateur packet radio contact by meteor burst on the 50 MHz band. I have had confirmed contacts with all 50 states and 6 continents on the 50 MHz band, and have communicated with over 69 countries on that band.

NO NEW LICENSE CLASSES NEEDED

4. As explained below, there is no evidence that the present minimal amateur code proficiency requirement has significantly reduced the number of highly technical individuals in amateur radio. To the contrary, most highly-technical amateurs hold high-code-speed licenses. Thus I see no need for a no-code license to attract technical persons. A no-code license will not attract the technical person who now uses the present code proficiency requirement as an excuse for not having an amateur license, when the real reason is lack of interest or lazyness. Given that a Communicator class will have essentially the same technical exam as the present Technician class, I fail to see how the Communicator class can attract non-technical persons to amateur radio.

Sorted by Amateurs per Capita Sorted by Density of Stations

Amateurs per Thousand Population	Country or State	Amateur Total Country or State	Stations /sq mi	Population /sq mi

0.32 Italy Australia 0.006 5
0.25 France Canada 0.006 6
Table 1 - International Amateur Data

* Since Japanese operator licenses never expire, this number is a count of all licenses issued, not a count of currently-active amateurs. For example the 1990 International Call Book lists 34,344 Japanese amateurs, a far cry from the claimed "one million". About 80% are no-code licensees who can operate all modes, 10 W, all bands except 10 and 14 MHz. Japanese amateurs and this factor is reflected in these computations.

5. The accompanying Table 1 illustrates that only in Japan, Denmark and New Zealand do a larger portion of the population hold amateur license than in the U.S. It appears that the vast majority of Japanese "radio amateurs" are, in fact, essentially Citizens' Band operators - and are not even in the International Call Book listing of amateurs. This, even though Japan allows no-code licensees on the long distance propagation bands below 30 MHz in contravention of international conventions. The United States is already nearly at the top among nations in per-capita incidence of radio amateurs. Many of our states have amateur population densities exceeding those of similarly-sized European countries. What percentage of the general population should be radio amateurs?

6. I see no justification for a no-code license, since our present experience (see below) shows that highly-technical people are not put off by a minimal code requirement, and any reasonable technical exam will deter people who have no technical interest in radio. Table 1 shows the U.S. to have among the highest incidences of radio amateurs, yet most of the other countries in the Table have no-code VHF/UHF licenses. This Table indicates that foreign no-code licenses haven't resulted in an incidence of radio amateurs higher than that we already enjoy in the U.S. A possible exception is Japan, which I consider not really comparable because of the perpetual operator's license. The only sure way of increasing these numbers is to debase the licensing requirements.

CODE NOT DISCOURAGING TO HIGHLY-TECHNICAL PERSONS

7. Some say that the code requirement discourages highly technical people from becoming radio amateurs. With this in mind, I have looked into the license class of the people who are active in technically-advanced aspects of amateur radio. I used three sources: a listing of packet-radio activities in QEX newsletter (from the American Radio Relay League), all U.S. amateurs mentioned in the March 1990

issue of the Radio Amateur Satellite Corp. (AMSAT) "Journal", and all "tenth call area" (W0) members of the Central States VHF Society (CSVHF - advanced VHF, UHF, and microwave enthusiasts).

Activity	License Class				
	Extra	Adv.	Gen.	Tech.	Novice
Satellites	15	14	0	0	0
Packet radio	6	6	1	4	0
VHF & Microwave	48	39	15	16	0

Table 2 - License Class Among Interest Groups

While only about 57% of the total U.S. amateur radio population hold 13 or 20 word-per-minute licenses, 100% of the amateurs mentioned in amateur satellite design, construction, and operation held high-code-speed licenses. In packet radio, the activity generally thought to be most interesting to younger "digitally-oriented" amateurs, I find that 76% of those mentioned hold licenses requiring 13 or 20 word-per-minute code. Over 86% of the VHF/UHF/microwave experimenters and operators in CSVHF held licenses requiring 13- or 20-wpm code. This data shows no evidence that a CW requirement has discouraged technical people from becoming radio amateurs. To the contrary, ALMOST ALL OF THE PEOPLE IN HIGHLY-TECHNICAL ASPECTS OF AMATEUR RADIO HOLD 13- or 20-WPM LICENSES. This refutes a major argument for a code-free license class.

CODE PROFICIENCY FUNDAMENTAL TO BAND-SHARING

8. Radio amateurs share their frequencies among many modes of operation, an important one being radiotelegraph code. For this sharing to work, all amateurs must have some knowledge of the code to be able to comprehend the activity of the other amateurs sharing the band. The Commission will receive other Comments pointing out the importance of code in emergency and VHF/UHF weak-signal situations. The fundamental requirement is that all amateurs have at least a minimum code proficiency so that these and other code activities can take place without unknowing interference from no-code amateurs sharing the same bands.

CONTINUE ISSUING TECHNICIAN CLASS LICENSES

9. I urge that the Technician license continue to be issued, and that Technician operating privileges be expanded to allow operation on (a) additional HF CW frequencies - about 40% of the HF CW bands, (b) all amateur frequencies and modes above 28 MHz. Technicians should be limited to a power of 200 watts below 30 MHz. Thus the Technician class

will be recognized as a transitional class with full VHF-and-up privileges, moderate-power all- mode privileges on the 28-MHz band, and substantial moderate-power CW privileges on most of the HF bands. In many respects its privileges would be similar to those of the old Class B license. THE TECHNICIAN CLASS SHOULD BE A VALUABLE "ALL-BAND" LICENSE.

10. I oppose the creation of a no-code Communicator license class. However, if the Commission choses to create such a class, the solution to the problem of Communicator-with-code, set forth below, is to retain the Technician class of license. The requirements of any possible Communicator written examination should be same as for Technicians. Technicians are, of course, required to take element 1A, code at 5 wpm. The FCC's proposal for Communicator-with-Code specifically mentions the continued use of test element 1A. If the Communicator-with-Code has taken all the examination elements appropriate for a Technician license, why not issue the Tech? The Technician class recognizes the considerable use of CW on the bands below 220 MHz, and the international CW requirement below 30 MHz.

ISSUE NO NEW GENERAL-CLASS LICENSES

11. The Commission has proposed phasing out the Technician and Novice classes, which I think is an error. This drastic proposal has caused me to examine other license classes. General and Advanced classes have the same code requirement and they differ by only a written examination designed to ensure more adequate technical knowledge. I feel that the General-class technical requirements are not adequate for full-power HF operation. The General class appears to exist primarily as the result of the grandfathering of the old Class B license to General, and Class A to Advanced, at a time when equipment was much simpler than today, and when the bands were much less crowded. The Class B license had radiotelephone privileges only on the 160- and 10, 6, 2 meter and up bands. If I remember correctly, 40-meter phone and 15 meters were added after the change to General class. These restrictions are similar to the current Technician license. The Technician class allows HF code operation, (which I suggest be broadened) which was not foreseen when both the General and Advanced classes were created. The Technician class already fills the place of the former Class B license. I do not believe that anyone can show that the differences between the present Advanced and General classes can justify the expense and administrative burden of continuing to issue both of them. I propose that no new General-class licenses

be issued, but that present General licenses be renewable indefinitely. Future applicants desiring more than 200 watts on HF, and other HF operating privileges beyond the Technician level, would have to demonstrate the technical knowledge required of Advanced-class amateurs.

NOVICE LICENSES RETAINED WITH A SINGLE FIVE YEAR TERM

12. The Novice license should be retained as an entry route, primarily for the very young and old. However, it should be non-renewable. It was created to allow an easy entry to amateur radio through CW with on-the-air learning, an admirable goal. There must be some minimum knowledge level for competent operation of the highly- complex ALL-MODE amateur equipment of today. The Novice exam does not require this minimum level. Thus I propose that the Novice license be restricted to CW operation, and that all Novice licenses expire after a single five-year term. This is enough time to allow the Novice to learn enough to obtain a higher-class license. I also propose that Novice license exams be administered under the Volunteer Examiner (VE) system, so that Novices can be given CW (element 1A) and Radio Regulations credit toward all the higher-class licenses. Volunteer examiners are allowed to collect a fee to cover expenses, there are many examples of this being waived. I am sure that the fee will be waived for the participants in many of the license-preparation classes, and should thus not be a burden to the young. In any case the fee is roughly the same as the cost of a movie ticket or two. The Technician technical exam should not pose a problem to anyone 12 years old who is seriously interested in amateur radio. A person could be licensed as a Novice as young as 7 and still reach the 12-year-old educational level before a five-year Novice license expired. I considered a ten-year expiration, but feel the five-year period is adequate and provides a more immediate incentive for self-improvement.

TECHNICIAN CLASS SOLVES COMMUNICATOR-WITH-CODE PROBLEM

13. The Commission notes that its automated license processing system can handle only ONE additional class of amateur license, then it actually proposes TWO additional classes, Communicator-without-Code and Communicator-with-Code. These are disguised as one class, but the holder must use a callsign suffix when using the additional operating privileges, even though FCC proposes the same privileges as the to-be-phased-out Technician class. How does the Commission propose to fit these two variations of the Communicator class in the single "slot" in its licensing system? In order for amateur radio's self-policing to be

effective, the FCC's amateur licensee database (which supplies license-class information to the Callbook) must reflect the -with-Code and -without-Code status for each Communicator licensee.

14. A much better solution than suffixes and two versions of the Communicator class is to retain the Technician class of license. I believe the requirements of any Communicator written exam should be the same as the Technician exam. The FCC's proposal for Communicator-with-Code specifically mentions the continued use of test element 1A. If the Communicator-with-Code has taken all the examination elements appropriate for a Technician license, why not issue the Technician license? I contend that retaining the Technician class is much simpler and more straightforward than having sub-classes within the Communicator class.

COMMUNICATORS, IF CREATED, SHOULD OPERATE ABOVE 220 MHz

15. Should the Commission create a Communicator class, I urge that it be limited to frequencies above 220 MHz. No-code operation on bands below 30 MHz would be unworkable. Communicators operating below 30 MHz would have international effect - even if they communicated only with US stations, they would interfere worldwide. Long distance radio wave propagation is a natural phenomena not subject to modification by Federal regulation. I am a strong supporter of increased use of higher-VHF and UHF amateur allocations, and feel official promotion of greatly increased use of busy low-VHF bands (by Communicators) would be extremely short-sighted. Communicators, if required to operate above 220 MHz, would NOT be in a backwater of amateur radio. The 420-450 MHz amateur band is already used by enough experienced amateurs to ensure continual contact between Communicators and existing experienced amateurs. I am convinced that present amateurs having Communicator spouses or friends would become active on the higher bands. If the Commission makes its allocation decisions based on perpetuating lowest-common-denominator operating habits, rather than urging increased use of the thoroughly-practical higher bands, it will be doing amateur radio a great disservice. The Commission may receive comments noting limited present activity, even on the 430-450 MHz band, in places like Wolf Point, Montana, or even Houghton, Michigan (which is well north of the population center of Canada). It should also note that these are very sparsely populated areas, unlikely contain many amateurs, new or old. The September, 1989, FCC amateur data base showed 25 amateurs in Houghton (pop. 7,500), which is about 70 miles from the nearest larger town (Marquette).

16. Nearly every mode of radio propagation occurs on the 6-meter band. The "weak-signal" amateurs in the lower end of the band have become expert in the practical aspects of these many modes, a valuable educational aspect of amateur radio. This band is the amateur band best-suited to meteor-burst communication, which is becoming more common as the necessary computers become part of amateur stations. A number of 50 MHz stations communicate by ionospheric scatter on a very reliable and regular basis. These and other modes employ very weak signals and sensitive receivers, often require use of CW, and their users value the cooperation of the amateur community that operates at the low end of the band. This operation is entirely incompatible with the normal big-signal FM and packet operation which predominates on most parts of the VHF and UHF bands, and which would doubtless attract the vast majority of the Communicators.

17. The upper part of the 6-meter band is adjacent to TV channel 2. Even the best TV set can't reject strong nearby signals in the upper part of the 6-meter band. The Commission is asking for trouble if it encourages widespread use of the upper portion of the 6-meter band by numerous 200-watt Communicator stations in residential areas. Channel-2 TV stations also have substantial (but legal) lower sideband output within the upper part of the 6-m band, which makes that portion useless for weak-signal amateur use. Many of the weak-signal modes require use of the full legal amateur power.

18. An operating privilege once given (Communicators on 6 m and 2 meters) is very hard to take away; thus some initial conservatism is in order.

SIMPLIFIED EXAMINATION SEQUENCE

19. My suggested licensing structure allows a simplified examination structure, as follows:

Class Code Exam Written Exam
==========
Extra* 20 wpm Same as Advanced plus Extra theory
Advanced 13 wpm Same as Technician plus advanced HF theory
General NO NEW GENERAL-CLASS LICENSES SHOULD BE ISSUED
Technician 5 wpm Same as Novice plus VHF, UHF and intermediate HF theory
Novice 5 wpm Regulations plus simplified HF theory
If the Communicator class is created against my advice:
Communicator none Same as Technician

Table 3 - Suggested Examination Constituents

* Though not germane to the present proceeding, I feel that the Commission should phase out the Amateur Extra class.

The reserved Extra-class subbands are used primarily to contact foreign amateurs who have not passed a 20-wpm code exam, thus there seems little justification for the 20-wpm requirement for US amateurs on these subbands. I am sure that the Volunteer Examiner system can establish some sort of accreditation for its code examiners to substitute for the Extra-class requirements.

CLASS-CHANGE SUFFIXES USELESS

20. I am disappointed that the Commission persists in pursuit of "administrative neatness" by having recently-upgraded stations use a distinctive suffix when using the new privileges. For example, the FCC proposes to require the PERMANENT use of a suffix when Communicator-class licensees use Technician-class privileges. There are two major problems: (1) the perpetual use of the suffix is unwieldy, and (2) the suffix serves no useful enforcement or administrative purpose, as shown below:

Enforcement Station Responses

Situation	FCC Requires Suffix	No Suffix Required
Use of Higher Privilege without Authorization	Must look up in listing to see if upgrade issued.	Must look up in listing to see if upgrade issued.
Use of Higher Privilege with Authorization	Operation is legal	Operation is legal

Table 4 - Upgrade Suffixes Useless for Enforcement

The listing of upgraded stations can never be up-to-date because of inherent processing delays. Why, then, require use of an unwieldy "upgrade" suffix? It would be a particular impediment on CW on the HF bands, where it would be permanently required for Communicators unless the FCC adopts my suggestion to continue to issue Technician licenses.

SUMMARY

21. The General class represents an unjustifiable processing burden, and is inadequate for full-power HF operation, and should be phased out. The Technician class is important as a transitional class with full VHF-and-up privileges, while offering substantial, limited-power HF privileges. The Technician written exam is within the grasp of anyone who has mastered the technical skills necessary to operate the full range of modes possible with modern amateur

radio equipment. The Novice license should be non-renewable. It should be limited to CW operation, since its technical testing is inadequate to demonstrate the capability to operate complex multimode equipment.

22. The proposed no-code Communicator class of license is a mistaken attempt to increase the quantity of radio amateurs by eliminating the fundamental common knowledge of CW - necessary for effective band-sharing. However, should the Communicator class be created, it should be limited to the thoroughly-practical-but-lightly-used frequencies above 220 MHz, and its written exam should be the same as that for the Technician class. Then there would be no need for the Communicator-with-Code confusion.

23. We cannot afford a proliferation of different classes and endorsements with infinitesimal differences and a special test for each. As mentioned above, I feel that the Commission should phase out the Extra class. Following my suggestions, the FCC would have a reduced number of classes being newly-licensed:
Extra*, Advanced, Technician, Novice.

* The Commission should initiate proceedings to cease issuing the Amateur Extra class license. The General Class should also be phased out, as mentioned above.

Respectfully submitted,

Robert J. Carpenter

]>There is a significant difference between the computer on Usenet and
]>a repeater. The computer does not tie up any significant natural resource.
]>The repeater does: its frequency pair. Here in Arizona its frequently hard
]>to coordinate frequency for an open repeater, simply because closed
]>systems already control the frequencies for an area. I think this
]>is completely wrong, and an abuse of the public trust. I am opposed
]>to the coordination of ANY closed repeater. Sure... put up a repeater
]>and close it. But don't expect it to have any claim on either the
]>input or output frequency! If I want to carry on a simplex conversation
]>on the input frequency, using the repeater's PL, that is my right!
]
]Unfortunately it is not your right, the FCC calls it intentional
]interference if there is a conversation going on thru the repeater
]at the time. It has always been considered bad amateur practice
Interference is interference. It has not relevance to this discussion.
In other words, no matter what frequency I operate on, if I cause
interference INTENTIONALLY, it is "malicious interference" and is
against the law.
]to operate simplex on a repeater input frequency whether the repeater
]is open or closed or even if there is no local repeater at all.

Yeah, this is true. I should have said "output frequency."

]>Here, repeaters can be placed on the air by any ham with a Technician or
]>higher class license. Sometimes, for various reasons, the person
]WA2ISE> or club who
]>sunk thousands of dollars into the machine wants people who use it to
]>help him with the expense of maintenance and operation, as well as the
]>up-front cost of the machine.

Gee... we have never had trouble getting funding for our OPEN repeaters.
I would suspect that repeaters that are USEFUL are easy to get funding
for. A few years ago, six of us in AZ put up a wide area 440 link system
(with 8 repeaters on 7 sites) called NORTHLINK. We funded it initially
by using our own money, and doing tower/site work for commercial
folks to get money and site agreements. We then allowed users to
contribute $15.00 per year IF THEY WANTED TO. We get plenty of
money, and are using it to expand the system. I should point out
that this is the ONLY OPEN 440 link system in the area. All others
are closed.
]>
]I have gotten the impression (from somewheres) that if you join one repeater
]group that runs an open machine, that you don't need to join (ie, fund) other
]machines that you might occasionally use. And that your group lets other
]people from other repeater clubs use yours.

I think that, in general, if you use an open repeater a lot, you
should contribute to the costs. If you use it occasionally, you
don't need to, although it might be a good idea.

Were I to do weak-signal work, I'd use a properly-designed and easily-built digital signal processing receiver. Such can receive and decipher signals so far down in the noise that you couldn't even tell there was a CW signal there.

The supposed advantage of CW for weak-signal work is an illusion with recent technology.

>How 'Bout getting a Tech license? :-)

That is my tech license. I hadn't had my novice license for a week when I went to take the tech test. Because of such a short time, I decided to keep ooit. :^)

BTW, you were hitting the .310 machine real nice from Crystal Peak (why isn't it called peak 11?).

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

> - Brian

But this technology is not available anyplace except the research lab at the present time. Therefore, CW still holds a strong advantage. When this technology makes it onto the market, and is published about in the amateur magazines (fat chance of that in the USA), then I will agree with you. I still don't know anything about this technology, except that people have claimed that it exists, because it's not my field. I would like to know more. Perhaps you can point me to a couple of papers?

Why is it necessary for someone who is only interested in working SSB DX
to "get through" when SSB can't do it?

> As I said before, you can work weak FM signals, but you aren't working a
> "weak signal" mode. "Weak signal" modes implies narrow bandwidth. FM,
> even NBFM, is far too wide. FM also has the problem that you must
> almost saturate the limiter before you get a usable signal. You loose
> about 10 - 15 dB right off the bat, even if you don't consider the
> losses from the wider signal.

Wrong. You can get a readable signal on FM before the limiter is even
near saturation. It isn't full quieting, but that's part of the game.
FM isn't the best mode for it, but it sure works a lot better than you
make it out to, which makes me suspect your abilities to work voice.

But I'd rather use SSB and NOT CW.

> If you do show up in the weak signal portion of the band, using SSB, and
> the time comes to use CW, and you refuse, then you are a lid. Using SSB
> is just fine for chatting with your buddies in the next state only 250

> weak signal modes. When you refuse, because of incompetance or any
> other reason, then you are a lid. I hope that when the time comes to
> use CW, that you will either use CW or get off the air.

You STILL misunderstand what motivates me to operate weak signal DX.
The motivation does not include CW because I am interested in SPECIFICALLY
getting a particular KIND of information through: VOICE. CW does NOT
get VOICE through, and the VOICE is what I am interested in.

We have DIFFERENT interests in weak signal work, but you are calling me
a LID and trying to keep me out just because I won't conform to your
methods of operating. How would YOU feel if *I* was calling you a LID
for demanding I change my goals on voice, and tried to get you off the
air for not operating the way I would?

If the signal level is such that SSB cannot get through, the only thing
I will be interested in at that time is to find another station that I
can work with SSB. I'm not interested in working the station CW. Don't
try to dictate to me what I should be interested in.

If I happen to be operating ATV at the time, I'm NOT going to be in the
mood for someone complaining about a P0 picture and trying to get me to

switch to SSB or something JUST TO WORK ME. When I am on ATV then I am on for working ATV and that's it. When I am on SSB I'll be there to work SSB and that's it.

Ken...

Your life would be a LOT nicer if everyone knew CW at 13 WPM or more. So petition the FCC to add:

97.1 Basis and Purpose.

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:
(a) ...
(b) ...
(c) ...
(d) ...
(e) ...
(f) Contribute to the well being, convenience, and happiness of operators who prefer, at times, to operate using manually keyed Morse Code Telegraphy.

This is a valid point. However, I think you are overlooking the fact
that this type of equipment does not come FREE. I have seen quite a few
people break into ham radio using tube and hybrid rigs because they
could not afford the fancy new appliances with all the bells and whistles.
The advantage of CW is real in weak signal work. The illusion is that
technology solves all of our problems. Then again I only have 22 years
of licensed operation to draw my conclusions from...

When I took my Technician exam, the VE's tried to get me to go ahead
and take the Advanced and Extra written exams. They also suggested
I take the code test as well even though I knew I could not pass it.
I turned them down. But now that I think about it, if I had taken
those tests and carried exam credit, I might have be just a bit more
encouraged to relearn code. Maybe someday.

Besides, having taken and passed the code test will mean more PERSONALLY
for me AFTER it is no longer REQUIRED because I will know that it was
done NOT under duress. I wil have achieved it TOTALLY on my own.

> question, is it a good idea to take the technician element at the same time?

I assume from this you will be taking the Novice where you have a chance
to also take a Technician.

The answer is that it really does not matter. Go ahead and take it, and
if you pass, great, BUT you still have to wait for a call sign. At least
then you won't have to go through the phase of UNLEARNING to say "Interim
KT".

This is one reason the FCC won't (and WISELY) touch the issue of making coordinators official. There could be some awesome legal problems in doing so.

It's groups that behave that way that are effectively inviting coordinator wars.

Think about where the AUTHORITY of a coordinator to deny a coordination SHOULD come from?

Brian Kantor mentioned that the VE's in his area required the applicant to take the CW portion before they'd give the writtens. I don't think that is the intent of VE testing. I don't see any reason why ANY applicant should be denied the opportunity to take a written and (if he/she passes) get credit for it. After all, it should be good for a year during which time the candidate can pick up the CW (speed).

Don perley writes "Liberated or not, they probably won't be interested in most of the 'ladies activities' people have been talking about here".

Why not lets us let *them* make the decision. If only a few are interested that's still no reason to deny them that activity just because there are some thin-skinned people who manufacture offense at it.

WHAT??!? I know that no one individual OWNS a frequency, just like
a broadcaster doesn't OWN the frequency that they are licensed to transmit
on. But I think this tactic of moving an "open" repeater onto an
existing repeater's frequency has been tried in L.A., and was always
resolved in favor of the repeater that was coordinated there first!

Was the above REALLY written by the normally sober and level-headed
Mr. Karn?

UoSAT / Microsat BBS Passes Alpha Tests

During "Colloquium Week" at the University of Surrey (UoS), Harold Price, NK6K and Jeff Ward, G0/K8KA, made significant progress in testing store and forward communications software on UO-14. This software will also be run on AO-16 and LO-19 after it has been completely tested and debugged on UO-14.

Once Harold arrived at UoS, he and Jeff went directly to work loading the 210 kbytes of code to UO-14 for testing. The tasks loaded were: hit.exe (the Housekeeping Integration task), cpe.exe (the Cosmic Particle Experiment data collector), mfile.exe (the RAMDISK file system server), tlm.exe (the telemetry server), qax25.exe (the AX.25 "virtual TNC") and ftl0.exe (the BBS itself "File Transfer Level 0").

During the course of the week, it was necessary to re-load the software 5 times, to overcome operational glitches and install bug fixes. When the satellite wasn't in range, memory dumps were examined and new code versions were compiled and ground-testing. For ground tests Jeff and Harold used 2 IBM Real-Time Interface Co-processor cards (in their respective PCs) and the UO-14 engineering model (at least the bits of it which would fit onto Jeff's desk).

To stress the software and reveal bugs, they started a bulletin broadcast, which fills any free downlink time with UI frames. With this running, they connected to the BBS and downloaded a 30 kbyte file. Throughout the test, European stations continued digipeating. After downloading the file twice without incident, the 'alpha tests' were declared complete.

The success of the hard work performed by Harold and Jeff now clears the way for the following activities:

(1) Release of the UoSAT/Microsat PACSAT protocol specifications. Complete definitions of PACSAT File Headers, PACSAT Broadcast format, and the File Transfer protocol Level 0 will be freely available. All of these have been in draft form for some time, and Harold is getting final versions ready for publication in the ARRL Networking Conference proceedings. If all goes well, they should also be available in electronic format in early fall.

(2) Development of user groundstation software for BBS access. The FTL0 protocol is designed for automated access (not hunt-and-peck keyboard control). Once fully tested, this software will be made available through

AMSAT-UK and AMSAT-NA thus making UO-14 truly open for access.

(3) Porting of the file system and the FTL0 BBS to AO-16. Although most of the code will run without modification, there are some differences in satellite hardware and "operating philosophy" which must be accounted for. This specifically involves drivers for the RAMDISKS, and support for ALOHA access on the A0-16. (UO-14 will use an experimental reservation multiple access scheme, with only limited ALOHA contention.)

This is, of course, taking longer than a similar BBS-only effort would on the ground. Remember that UO-14 is simultaneously running six programs: sampling telemetry, collecting data from the Cosmic Particle Experiment, providing a multiple-connection virtual TNC, broadcasting using a new point-to-multipoint protocol, and waiting for full-duplex binary file transfers at 9600 bits/second. Including DOVE and WEBERSAT, 6 programmers in 2 continents and 4 time-zones have collaborated to bring this together.

[ANS thanks Jeff Ward, G0/K8KA for the information for this bulletin]

AMSAT-UK COLLOQUIUM, PART 1

HR AMSAT NEWS SERVICE BULLETIN 216.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

The following summaries from the AMSAT-UK Colloquium were received from Richard Limebear, G3RWL.

The Colloquium was held at the University of Surrey, England from July 26 to 29, 1990. Over 200 people from about 29 countries were in attendance. This annual event is one of the premier Amateur Satellite sessions held anywhere. Additional details are forthcoming in an upcoming issue of OSCAR News.

* Russian Satellites *

The RS14/RUDAK-2 launch has slipped, the current word is October 1990. Apparently the RSM modulation promised stands for Rectangular Spectrum Modulation but no other information about it is available at this time. The 70cm link will apparently use an RHCP aerial while 2m will use a dipole. Only one transponder will be switched on at a time and that will normally be RUDAK; the analogue transponder is considered to be a reserve.

** BADR-1 New Satellite **

SUPARCO (the Pakistani Space & Upper Atmosphere Research Commission) launched a small UoSAT-2/FO-12 class microsatellite into orbit on 16 July 90.

The Keplerian elements indicate that this orbit is pretty eccentric; as much as FO-20 but a lot lower in altitude. Perigee/apogee at this time are about 198/982 km but by November they'll be 125/900 km - in other words it won't live long. Also, with an inclination of 28 degrees, perigees close to the UK won't rise above the horizon there.

Information received from Suparco says that telemetry is of the UO-11 type;
the two transmitters are on 145.825 and 144.028.

AMSAT-UK COLLOQUIUM, PART 2

HR AMSAT NEWS SERVICE BULLETIN 216.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

* FO-20 *

At the Colloquium JARL said they will issue an award for Mode JA operations.
It was pointed out that satellite users could do with some more mode JA time;
some arrangements were made for this and also for the FO-20 operating
schedule to be PUBLISHED in the future.

** ARSENE **

F6BVP gave a comprehensive presentation about their long awaited satellite.
ARSENE (Ariane Radioamateur Satellite pour l'ENseignement de l'Espace) will
be mounted INSIDE the Ariane rocket's separation collar on the September 1992
flight carrying the Telecom 2B payload. The final orbit is expected to be
equatorial with apogee = 36,000 km and perigee = 20,000 km with a period of
seventeen and a half hours. Visibility figures for the UK for this type of
orbit are "interesting" to say the least - the longest pass seems to be
about 31 hours and gaps of 48 hours between passes will occur from time to
time.

A solid fuel rocket motor will be used to raise the perigee after launch into
Geostationary Transfer Orbit. This spin-stabilised satellite will carry
three deployable solar panels and be earth-pointing using nitrogen gas for
attitude control; lifetime expected is on the order of five years. The
six-sided body will measure 900mm in diameter, be 880mm high and weigh about
140Kg before the kick motor firing.

The communications payload will have a 70cm uplink and 145 and 2445 MHz
downlinks; the two modes, B and S, will NOT operate simultaneously. Mode B
operation will be FSK packet radio (3 uplink channels, one downlink) and mode
S will be a linear transponder.

** AMSAT-Isreal **

Amsat-Israel announced that they intend to follow the example of universities
abroad and launch their own satellite project. Plans are for a small store-
and-forward spacecraft, perhaps also carrying scientific experiments.

AMSAT-UK COLLOQUIUM, PART 3

HR AMSAT NEWS SERVICE BULLETIN 216.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

** UOSAT-F **

There is a proposal for the UoSat-F spacecraft to be launched on an Ariane flight in April 1991. If the proposal is realized, Amsat-UK will make a significant donation to the project which is also hoped to carry a Mode A transponder.

** PHASE-3D **

Design requirements for the Phase-3D satellite were discussed. The plan is to improve links by more than 10dB above AO-13 levels by using more power, more antenna gain, and anti-alligator measures. The preliminary specification has a 250W PEP transmitter in a 3m diameter toroidal shape weighing 400 Kg. Amsat-DL would like it to carry X-band (10GHz) and other microwaves plus experiments and educational features as well as the "normal" communications payloads.

SAREX IS #1 FOR LAUNCH

HR AMSAT NEWS SERVICE BULLETIN 216.05 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT
NASA Has Set Tentative Launch Date for ASTRO-1 / SAREX Mission

NASA will roll out the Shuttle Columbia to the launch pad in the next few days, having repaired the Hydrogen leak that forced a rollback to the VAB (Vertical Assembly Building) in May. Although the final date and time will not be firm until the Final Readiness Review, which is held about a week before launch, a tentative date of September 1 at 5:00 GMT (23:00 EDT on Aug 31 on the Cape) has been set. The night launch should provide dramatic visuals for the sendoff of Ron Parise, WA4SIR, and the SAREX mission.

While Ron is tending to his duties as a Mission Specialist on the ASTRO-1 project, his amateur station will be busy acting as a Packet Radio "QSO-Robot". During his "off time" Ron will be actively making contacts on 2 Meter FM. Ron also plans to spend time communicating directly with school children across the country. A number of schools have been selected to communicate, using amateur radio, to Ron while he is in orbit. This will provide the students the opportunity to ask him questions about his mission as well as space travel in general. In a sense, the long delay of STS-35 can be viewed in a positive manner. Many of the students which will participate in Ron's "classroom visits" will be back in school and not out on vacation as would have been the case if Columbia was launched in July or early August. What a great way to start the school year!

Live Shuttle audio commencing prior to the launch and continuing throughout the entire mission of SAREX will be re-transmitted from the Amateur Radio Club Stations at Goddard Space Flight Center, Greenbelt MD (WA3NAN), the Johnson Space Flight Center, Houston, TX (W5RRR) and the Jet Propulsion Laboratory, Pasadena CA (W6VIO). Stay tuned to ANS for further details as they become available.

[ANS thanks Bill Tynan W3XO, AMSAT VP of Manned Space Programs for the information in this bulletin]

WO-18 SPACE SCIENCE STUDIES

HR AMSAT NEWS SERVICE BULLETIN 216.06 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18: Space Science + OSCARs = FUN!

Curious hams often wonder if science can be fun. Combine space science with OSCARs and you get an unusual mix of exhilaration and excitement by observing a phenomenon that would be missed in normal daily life. This is what the students at Weber State University (WSU) discovered when they recently noticed that WO-18 was going to pass through a total solar eclipse as its orbit took it over Finland and Siberia. Ground controllers took advantage of this fact and quickly started to prepare to take pictures of this event using WO-18's CCD camera. It was their hope to snap a picture of the earth as WO-18 passed through the penumbra and umbra. Also, the Whole Orbit Data (WOD) telemetry mode was programmed so that solar panel array currents could be recorded and examined later. The very difficult task of planning the telemetry capture and picture taking during this event was quite taxing, however, it paid off as the WOD data revealed that WO-18 did indeed pass through the solar eclipse at the exact predicted time. The CCD camera was programmed to take eleven pictures, one every 13 seconds. The first picture was to be snapped at 02:42:35 UTC on July 22. As WO-18 came back over WSU on the next pass, an immediate dump of the telemetry showed that the their predictions had been perfect. The WOD showed a marked decrease in solar array current. But alas, no pictures were taken which accurately showed what the earth looked like during an eclipse. Although that is what WSU engineers wanted so see the most, this time it was did not happen. Not to be discouraged, in future solar eclipses, WSU engineers plan to do this again until they do snap a picture of the earth during a eclipse.

In another interesting scientific observation, the microscopic particle impact detector on WO-18 recorded a significant number of collisions during a recent meteor shower! During one day the impact detector noted eleven hits during one orbit. Normally, the impact detector only records two collisions a day! Once again, WSU engineers will be planning WOD operations during future meteor showers as they continue to study this.

Chris Williams (WA3PSD) reports that significant progress has been made in further refining picture taking strategies. WSU engineers now have a better understanding of how to use the information from photo cells to determine when WO-18's CCD camera is looking down at the earth. Also, new software algorithms to decide when to take pictures are being developed.

Finally, WA3PSD announces that WSU will be sending out a beautiful QSL card to those amateurs who have either captured telemetry or a picture from WO-18. Send your hardcopy of telemetry or data to:

WSU/CAST
Eng. Tech. Bldg., Rm #236
3850 Harrison Blvd.
Ogden, UT 84408-1805

WA3PSD joked that white pieces of paper or totally darken pictures don't count. It must be a real picture. Hi! Please include an SASE to expedite the return of your QSL card. For more information about the availability of WeberWare 1.0 which will process the image data from WO-18, contact AMSAT HQ's at (301) 589-6062.

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 216.08 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 190
Mode-LS : MA 190 to MA 195 (Mode S Beacon only)
Mode-S : MA 195 to MA 200

Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 240
Off : MA 240 to MA 003
Omni Antennas : MA 240 to MA 060

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:
BLON = 207 and BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling frequency of 145.910 MHz.

I don't think this will work. I believe this has been tried by some of
the participants in various "repeater wars", including the allegations
by the simplex operators that THEY were the ones being vicitmized by
the repeater operators.

This trick is so old, that I have not even heard of it being used since
the 1970s.

169. STS Radio help

Newsgroup: rec.ham-radio
Date: 1990-08-06 12:10:00 UTC
From: dls@genrad.com
Message-ID: <38256@genrad.UUCP>
Source record: 9575
Cross-posted to: rec.aviation,rec.ham-radio

I have an airplane band HT which is proving to be quite useless. It seems that the battery will not stay charged long enough to use it. The radio is an STS 600 (I think???) walky. I do not have the owner's manual and there never was a schematic included there anyway. I also know that STS has long since gone out of business.

If I put the HT on the wall charger (the battery is a SEALED 7.2volt case), then I can turn on the radio and use it normally. After charging it for 18 hours or so, if I use it immediately, I can listen to it for an hour or so before it goes dead. If I try storing it FOR ANY LENGTH OF TIME (like from my room at UWisconsin down to the Oshkosh airshow), the radio is already dead by the time I try turning it on.

ShellEy had suggested that that the internal clock was draining the battery, so simply remove the battery until use. That did NOT work. It was still dead when I reattached the battery.

As I said, the battery is SEALED, so I can't get at each cell individually and check them. Note that this is the second battery. The first one was doing the same thing, so I bought a new one (at $60) and still get the same results. This radio COULD be useful to me as a DFer (for 121.5....I'm in CAP)....I have used it as such a couple of times in past....but it's been quite frustrating to use, since it's almost always dead when I need to use it.

Any suggestions would be in order.

Thanks much.

You missed it Phil, the exam does not fully make the HAM. Think back to that first QSO you had, sweaty palms, nervous stomach and a jitters so bad you couldn't even hit the xmit button square. These people need a place to "paractice" (don't give me that c*** about perfect practice) without banging up the rest of the system. That was the intent of the segregated bands for Novice and Tech licences and should be for the Communicator licences. When they want more frequencies then let them get a full Technician ticket and have full Technician privilages.

If they want to "communicate" then they will keep Communicator class licences, if they want something more then they should get a class of licence which is intended to do more.

There is still a big identification crisis with this Communicator class licence particularly when they want to eliminate existing levels of licences and merge privilages the way it has been proposed.

I would love to see privilages for an entry level class which INCLUDES hf CW without requiring the current Morse test scenerio. It would go a long way toward building a strong HAM fraternity. I like the idea of being able to atleast send some Morse rather than just receive, heck, are we trying to licence SWLs??

Tell me, Phil. Are you of the opinion that ALL Communicators are going to want to jump right in and be TCP/IP priests and are going to behave the way 13cm weak signal jocks do? Will you admit that the vast majority of these Communicators will want to "communicate" and will probably act like CBers and HFers?

I am not going to claim that there will be hordes of Elmers waiting for these new HAMS but there will be a few and they will help and the word will spread and there will be a reasonable number who will upgrade for more privilages, for personal satisfaction and to protect their investment. Be practical, yes, they are HAMS, many will act like HAMS and more will not act like HAMS. I'll do my part to guide or convert those I contact but PLEASE, because of the probable nature of the majority of these new HAMS don't let them mess up an already shakey band.

Paul Nix (WB5AGF) InterNet: nix%muppet.decnet@consrt.rok.com asks;

<...I'm less sure of how to handle the money situation...>

Paul,

Most, if not all Ham places here will take credit cards. Mastercharge is called Access, Visa is called Visa or Barclaycard. They'll happily charge you in pounds sterling and the credit card companies take care of the exchange rate. It's generally an O.K. rate.

Alternatively, you could open an account at a U.K. bank. I believe Barclays operate in the US (I saw a branch in Boston, so I suppose they do.) That way you could send a cheque in pounds sterling drawn on a UK bank, but actually put money in the account in the US. (I have a very similar arrangement, only the other way round, with a bank in Philadelphia.)

73,

Hugh, G0CNR.

Paul Nix (WB5AGF) InterNet: nix%muppet.decnet@consrt.rok.com asks about buying stuff in the UK.

I forgot; MAKE SURE YOU GET THE VAT BACK!!!!

All the prices you see in RadCom include 15% Value Added Tax, which as a non-resident of the UK you are entitled to reclaim. It's a tedious procedure, but on a $1000 rig, very worthwhile.

When you order the stuff, make sure the retailer includes a VAT reclaim form. This needs to be stamped by the US Customs to prove the stuff's been imported into the USA (or more precisely, *exported* from the UK), and then returned to the UK Customs. They in turn will send you your money back.

There may be a lower limit on the amount you can do this on - I think it's a retail price of #50.

73,

Hugh, G0CNR.

Most of you people don't know what real repeater wars are like. Early in my ham career (i.e., 20 years ago) , there were several of them in the Los Angeles area that were famous as far as way as San Diego.

Simplex on the input? Child's play. What really cured repeaters in those days were chainsaws.

Seems that someone decided (pre-coordination, pre-ARRL-discovering FM, pre-ricebox radios) that despite the hundreds of simplex operators on 146.76, Los Angeles needed a 16-76 repeater, since, after all, that was a national repeater channel.

As the Chronicles of 76 report it, one day it went off the air. Upon arrival at the site, the owner found that the power and coax cables to his phone-pole-mounted outdoor cabinet had been chopped.

A few weeks later, it went off the air because all the tubes had been removed and smashed.

Finally, a few weeks after that, it went off the air because the cabinet had been cut in half vertically with a chainsaw, and the phone pole chopped into fireplace-sized chunks.

To this day, there is no 16-76 repeater in LA. And the coordinating committee has ALWAYS considered the simplex people when allocating channels. They never put a repeater on 34-94 for the same reasons. (A few years later the Mexican's clanked on 94 and 76 with their own repeaters, but that's a different story.)

No one was ever prosecuted for that stuff that I heard of, but one of the guys we guessed might be the one (no evidence; it just seemed his kind of thing) spent some time in the pokey on some unrelated charges, and later some time in outpatient treatment. He's dead now - private plane crash, I'm told.

Think of it as a saga of the Old West, ham style. Nowadays we just patch up the bulletholes in the buildings.
- Brian

Certainly you won't read much about DSP in QST until it's being
advertised in the back. However, it's been discussed here on the net,
at various ARRL conventions and specialized conferences, and quite a
bit in the electronics literature. I first read about it in Ham Radio
(RIP) magazine.

There is a DSP mailing list; there are experimenter's kits for DSP, and
I've seen demos of a reasonably complete DSP system at local ham clubs.
I seem to recall someone is going to give a talk on it at the SW Div ARRL
convention three weeks from now. Even the ARRL Handbook talks about it
a bit, although not in any useful manner.

In the 'hamradio' anonymous FTP area on UCSD there are a number of dsp
programs.

Oops, sorry, you wanted some citations. Most of these are popular
journals, so it's your library will have them; if not, the UCSD
libraries have most of them and you're welcome to come and browse if
you're in town for the ARRL convention.

These are only recent articles; our on-line current contents catalog
only goes back a year or two.

Hmmmmmmm....
When I was going from 5 to 13 WPM for my General I practiced every night
for 20 to 30 minutes... +MY+ wife never complained... In fact she
encouraged it... She saw that Ham radio is a +GOOD+ thing. What she
liked is listed below:
- Cheaper than a shrink. Ham Radio is very good relaxation and if you
have a high stress job becomes a haven.
- When I am playing with radios, I AM NOT doing the following:
- Drinking
- Running around with the guys
- Running around with another woman
- (aka she knows where I am)
- I can be interupted and I can do something with her.
(I may need 15 minutes to finish a QSO, but that is OK)
- It is fantastic for emergencies. When the big quake hit in October 89
she turned on the 2 meter radio in the car and could hear all of of the
HAM people that she had meet at club breakfasts and dinners. This gave
her the feeling that she was not alone even though I was 6 thousand
miles away in Taiwan. If she got into a life/death situation she could
+USE+ the radio to save her or someone else! (No flames on this...
Sheessshhh)...

So explain some of these things to your YL/XYL and see if she becomes
more +BEEP+ tollerant!

]
]Ohhhhhh......I don't think so! This has been tried during some of the
]"repeater wars" in Southern California, and believe me, the simplex
]operators were cited!

Cited for what? In order to be cited for harmful or malicious interference, they have to operate WHILE someone else is using the frequency, in such a manner as to cause interference. Believe me, having been the point man here in a repeater war (our group was NOT the agressor), I can tell you that it is not easy to get an FCC NOV in one of these cases. By the way, the Long Beach, CA branch of the FCC was the one involved in that case.

Cited for failure to maintain Good Amateur Practice? Perhaps, IFF the other repeater was coordinated. On the other hand, some of us consider closed repeaters to be failure to maintain good amateur practice.

Let me comment that my original suggestion about talking on the INPUT frequency was probably not appropriate, since you can't tell if you are causing interference. Perhaps I should have said OUTPUT frequency.

]I don't think this will work. I believe this has been tried by some of
]the participants in various "repeater wars", including the allegations
]by the simplex operators that THEY were the ones being vicitmized by
]the repeater operators.
]
I was personally involved in getting the FCC to recognize coordinating
bodies because of this sort of tactic. If a repeater is coordinated,
the FCC claims that they will give it primacy on its frequencies (which
is a good reason to not coordinate any more frequencies to closed repeaters).
If it is not coordinated, it is just another repeater.

The reason I used the word "toothless" is that the FCC is very reluctant
to get involved in repeater coordination wars. There have been several
cases where there were battles between coordinating bodies. The FCC
stance has been to either stand aside and recognize BOTH groups (which is,
of course, absurd, but happened in Sourthen California) or to ask for a
vote of the USER COMMUNITY (I believe this was suggested in Kansas City)!

Note that current coordinating bodies (such as the one here in AZ) are
usually controlled by existing repeater owners, who have a clear
conflict of interest in their position. Some years back I discussed
this problem with Carol Foelak (at that time the lawyer for PRB
ham radio issues) and she agreed that they had no good way to
deal with competing coordinators, that the conflict of interest in the
coordinating groups was the Achilles heel of the system, and that the interests
of the USER's must be considerd in coordinating decisions.

So, if someone wants to cause trouble (or maybe even do some good,
although I don't generally like such tactics), they can set up a
competing coordinating body that refuses to recognize the closed
repeaters. If they are clever, they will appeal to the USER community (which,
of course, does not have a large percentage of closed repeater users) and
maybe win FCC recognition OVER the old coordinating body.

As the need for frequencies gets more intense, more of these disputes
will arise. Today, there are many frequencies, throughout the country,
that are RESERVED for tiny groups with a few members. Also, there are
large organizations (such as Cactus) that tie up a large number of
wide area frequencies for their private use [I should note that Cactus
has made their system available in emergencies, but only if Cactus
members are available to control it.] This cannot continue. Where are
we going to put new mode repeaters? What if a large organization wants
to experiment with trunking technology (which would greatly relieve
band congestion)? Where do they get the frequencies? How about
digital modes (packet, digital voice, TDMA digital voice, etc)?
Why should almost all frequencies be tied up so that these private
groups can occasionally use a quiet FM frequency?

Certainly test-taking is a skill, but it's one whose bearing on the proper operation of an amateur station is marginal at best. And I don't know if "most" of the people who pass the upper-level writtens forget everything, but I've met plenty of Extras who I personally would not want teaching too many newcomers. I remember taking my Novice test, way back when, from an Extra who marked my answer to the following question as "wrong":

Question: How many times per second does a 60 Hz AC voltage pass through zero?

I'd answered "120", and try as I might, I couldn't convince this guy that the correct answer WASN'T "60"! And THIS was supposed to be an example of the All-Powerful-All-Knowing-Amateur-Extra?!??! Didn't make much of an impression on this Novice-to-be, let me tell you.

No, I don't hold an Extra today; I've no interest in DXing, and the slight extra bandspace isn't worth taking a 20 WPM test. I don't consider myself the technical inferior of the majority of Extras, though, and I DO know a number of Tech licensees that I consider just short of Maxwell and Edison in the technical hierarchy. Let's dump "punishment licensing" (as Wayne Green used to call it) as soon as we can!

Brandon, it was I and not phil who proposed that the CSCE be kept with a 30 day suffix. The difference is that changing your license class requires the FCC to update the main computer files and send you a new form 660 with a new expiration date, etc. A CSCE need merely be kept in a list for enforcement purposes, so when somebody is heard in a band that requires a CSCE, the FCC can look it up if they care. It _may_ be a bureaucratic shortcut, and the FCC is looking for that sort of thing.

Weak signals? Ask someone who uses the 1750 meter band!

Over the last year, the "Lowdown" (the publication of
the Longwave Club of America) has carried a series of articles
by Max Carter detailing a system for receiving and decoding
slow BPSK (binary phase-shift keying) signals in the 160-190
KHz (part 15) band. This equipment does not look particularly
complex - far simpler than packet stuff - and he reports using
it to decode and display the ID's of beacons which were much too
weak to be detected by ear.
I recommend this series to anyone interested in what can be
done to go beyond CW for weak signal communication *and* can be
put together by the average experimenter.

J. Patrick Harrington
jph@astro.umd.edu

(Just an astronomer who plays on 1750 meters because life is too
short to spend it memorizing Morse code.)

188. Mods/info wanted for Ten Tec Omni-D

Reply-To: peacock@dover.sps.mot.com.UUCP (Don Peacock)
Organization: Motorola SPS, Mesa, AZ
Lines: 17

I recently passed my novice and Tech test (haven't recieved them yet).
I purchased a Ten Tex Omni-D and have been listening to you all talk.
I would like to find mods for this rig, even though I wouldn't use them for
a while. I have the 10mhz transmit and WARC transmit mods from Ten Tec,
(Ten Tec IS as good at customer service as you have heard). Any mods,
or war stories would be appreciated. The rig seems to receive fine, and
all the built in filters are terrific (especially the CW ones) but I think
it could use some help in the SSB audio department. Anyone have any nice
audio filter/speaker projects that might help me out ?

Thanks
Don Peacock

I have added a couple of files to the anonymous ftp directory at
joker.optics.rochester.edu (128.151.240.1). I received one recently
and just ran across the other one, which was posted in March.
Descriptions follow.

dxcc.txt.Z
dxcc.arc

This is a list of DXCC prefixes, country names, lattitudes, and
longitudes. It appears here in arc and Unix compress formats. This
list was provided by by Bob Lombardi.

dxcc.list.Z

This list contains the following information:
1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s) ("~" suffix for unofficial)
10. other amateur prefixes
This file was posted to rec.ham-radio in March, 1990 courtesy of Bill
Brelsford.

> Any of the current handhelds are ok, but not in the car.

Actually, with a decent rubber duck antenna my FT411 works pretty well in my Datsun around town, especially if I plug into 12V and set high power (5.5W). Not nearly as well as with an external antenna, of course, but quite usable.

> You will find that the audio is not loud enough to listen to comfortably
> over the road noise...

Easy fix. Buy a couple of "ear buds" (for example, Koss, ~$5 at WalMart) and a stereo to mono adapter. (I have to turn the volume way DOWN to use them...) You can hear outside noise just fine with them on.

> The best car antenna is a 5/8 wave mounted in the center of the top.

However, a 1/4 wave is a heckuva lot shorter and nearly as good.

Subject: Amateur Radio as Public Service
Status: R

I don't know how other areas view ham radio, but the local agencies here think it is great, especially packet radio.

Our local county Emergency Services director applied for a FEMA grant for packet equipment. FEMA set a record for replying to a grant (they said ham radio? no sweat!) and gave a 50/50 grant. FEMA put up $3K to match the count county's $3K for a total of $6K to buy two complete portable packet sets, including synthesized two meter radios, TNCs, laptop computers with printers and nice crushproof cases to carry it all in. They think they'll have enough left over to buy one or two extra radios and Henry's TNC/printer combo for installation in a couple of receive only locations for unattended (by hams) locations.

Yes, up here in the Great White North ham radio is an integral part of the public safety system.

From: john@frog.UUCP
Message-ID: <17446@frog.UUCP>
Source record: 9497

I admit to not being up-to-date on the status of the 900MHz band, but assuming that there's still a place for ATV there, I saw something in the most recent DAK catalog that might be of interest.

They are now selling a gadget that attaches to your cable hookup or VCR (or other video source) and broadcasts it (via 910-918MHz) to a small receiver that you can attach to your TV. I know nothing about it other than the fluff DAK used to describe it, but it sounds like it might be a reasonably cheap ($105 for the set) way to build a 900MHz ATV exciter. It shouldn't be too hard to move it within the amateur band (I would hope).

The flip side of this is that shortly your neighbors may be filling the entire 910-918 Part 15 band with Three's Company...

> I plan on taking the novice exam in the next couple of weeks.

Good luck!

> I have a question, is it a good idea to take the technician element at
> the same time?

It is a good idea, once you pass a test element, to attempt the next level, if time permits and the examiners don't mind. For instance, when I passed the Tech two months ago, 100% after thorough studying, I gave the General exam a shot with zero preparation -- and only missed it by two questions. If I'd passed it, I'd have had incentive to bone up on code and upgrade within a year.

Don't burn yourself out studying, however.

199. Encoded serial number to replace QSL's to confirm DXCC etc QSOes.

Newsgroup: rec.ham-radio
Date: 1990-08-06 20:27:18 UTC
From: katz@weyr.FIDONET.ORG
Message-ID: <744.26BE6052@weyr.FIDONET.ORG>
Source record: 9500

Has anyone given thought to using a computer generated number which
a DX station would send along with the RST/RS to confirm that a
contact had been made. This would be used to replace the QSL cards
and the associated delays and costs.
Perhaps, the DX station could receive an encryption key which is hashed
against the call sign of the station worked, band and time. An algorithm could then
generate an encrypted confirmation number. All
that would be needed for an award would be a list of stations worked
and the encrypted confirmation number. The awarding agency could verify
the authenticity of the contact through the encrypted confirmation
number. Any thoughts on this is idea ... OR for that matter any
thoughts about the nature of the cypher algorithm?

200. 6m Base Antenna Ideas

Newsgroup: rec.ham-radio
Date: 1990-08-06 20:29:22 UTC
From: scotto@crash.cts.com
Message-ID: <3843@crash.cts.com>
Source record: 9511

We are looking for ideas on buying/building a good 6 meter base station antenna. There is one catch, it must be extreemly heavy duty.

This is for a mountain top repeater installation where the winter weather can be quite severe. Previous antennas have been constructed out of EMT, IRON pipe and stainless steel whips. All of these antenna ideas have given in to the ice and wind.

What do you use? What would you do?

Thanks in advance.

>Dube Todd N5PDK

I don't think a "computer" license is a good idea. It places emphasis on the computer instead of the radio. I also don't see a very large portion of the amateur community in support of this.

One of the key thing would be the number of users of such a service. If there were enough users that they would make good use of such an amateur band, then there would also be enough to ask the FCC to allocate a "CB" like band for such a service. The power and range would not be very high for such a system and there would only need to be a 20-40 khz spacing for a few channels.

It's just that if some amateur space were split off for computer service, it would be seen with the same light as the UPS chopping 220. The new users would not be ham-radio operators.

I would be interested in communicating with any Radio Amateurs
who are interested in the Solar Eclipse next year, July 1991.
I will be going to the eclipse in Baja California, with a mobile HF
rig, and it might be useful to have a network operating to pass along
information leading up to, and during the eclipse. Perhaps
a weekend network on 20 meters? Ideas anyone?

Think again.

Such an action, if it can be shown that you know that you are using the private repeater's PL, would be willfull and malicious interference; an action prohibited by FCC regulations.

>Were I to do weak-signal work, I'd use a properly-designed and
>easily-built digital signal processing receiver. Such can receive and
>decipher signals so far down in the noise that you couldn't even tell
>there was a CW signal there.

And you would talk to yourself, since no one else would be suitably
equipped to receive you similarly.

Also, you would spend a lot of time you don't anticipate writing special
code to cover for flutter, to make a myriad of interpretative reconstructions
of received sounds (unless you just reconstructed tones and used ear/brain
for data reconstruction, heaven forbid), and trying to get another person
or two to do the same so you could conduct meaningful communications.

This would be highly educational. Since this receiver is easily-built,
(and presumably inexpensive) I'm eagerly awaiting the details in QST,
QEX, the AMSAT-NA Journal, PSR, or some other periodical with a technical
section.

>
>The supposed advantage of CW for weak-signal work is an illusion with

Date: 1990-08-06 23:42:55 UTC
From: bote@csense.uucp
Message-ID: <1990Aug6.234255.791@csense.uucp>
Source record: 9508

We are designing a repeater controller interface circuit with both
analog and logic portions (unique, eh?). We decided to use separate
analog and logic grounds to reduce the switching noise appearing in
the audio circuits.

Now we have two grounds internal to our circuit board.
What do we do with them?

If we tie them together at one external point, does this still
retain the benefits of the separate internal grounds?

Do we need to provide some other means of isolation before pulling
the analog ground to 0 Volt potential?

Sure, just like everywhere else in the USA. And just as effective, too.

But don't misunderstand - it's not hams shooting at each other's
buildings. It's frustrated people plinking at The Phone Company, the
police transmitters, TV stations, the power company, etc. After all, doesn't
television teach us that that we can solve ANY problem by brandishing a
weapon at it?

And after all, you're all alone up there on the 5000 ft mountain, and
there's no police around, so there are no laws, so why not just express
your rage and frustration at those impersonal bureacracies by blowing a
few holes in their buildings?

That's sarcasm, son.

|> But this technology [DSP] is not available anyplace except the research lab at
|> the present time. Therefore, CW still holds a strong advantage.

What's a "research lab"? Does N4HY's basement count? Does W3IWI's? Does mine? We (and several dozen others) all have these Delanco-Spry DSP boards for our PCs. W3IWI is fond of calling them "the S-100-era DSP card" but they were enough for N4HY and W3IWI to read each other off the moon on 70cm using AO-13 class stations (100 watts, 13 dB gain, as opposed to 1KW and 25+ dB antennas). And, of course, everyone knows about the DSP-232 and other DSP products in the pipeline.

DSP is not "just research lab" technology. If you have a Telebit Trailblazer modem, you've got DSP. If you have a V.32 modem, you have DSP. If you have a compact disk player, you've got DSP. If you have a Sparcstation or NexT workstation, you've got DSP. (If you have a Mac or PC, you can get DSP, but it isn't standard.) If you see Voyager images, you're seeing the results of DSP. If you pick up a telephone and make a call outside your local area, chances are you're using DSP.

So it would seem that DSP is well entrenched in everyday practice in almost every communications field except for amateur radio. Doesn't that say something?

Phil

No, you can't buy it, you'll have to build it. But there's some nice development kits out there, and I rather imagine something that can plug into a PC bus isn't too hard to come up with. We'll see.

N4HY is working on some stuff. He'll undoubtedly beat me to it, since he's got things working NOW.

Honestly, I've never done RF DSP - but I've done a chunk of DSP in sonar and other oceanographic stuff, about 10 years ago, before the nice new chips were available, so I'm going to have to learn about what's available.

But DSP is clearly the way to go - hams are trailing commercial technology again, I regret to say.

|> You missed it Phil, the exam does not fully make the HAM.

I'm not sure which Phil you're talking to, but I assume it's me. And no, the exam certainly does not fully make the ham. I took my last test in 1973, before I had even left high school, and I'd like to think that I've learned something since then.

|> Tell me, Phil. Are you of the opinion that ALL Communicators are going
|> to want to jump right in and be TCP/IP priests and are going to behave
|> the way 13cm weak signal jocks do?

Of course not. But I don't see any other way to bring in the TCP/IP "priests" (and other technically oriented people) without it. There will always be chaff with the wheat. But at least we won't be throwing out the wheat.

> Will you admit that the vast majority
> of these Communicators will want to "communicate" and will probably act
> like CBers and HFers?

You use the terms "CBers and HFers" as a disparaging epithet. But have you actually LISTENED to the SSB CBers and HFers? I have. Except for the lack of callsigns and an apparent inability to standardize on either USB or LSB, they sound EXACTLY like the legit hams I hear anywhere else on HF. They carry on the same inane conversations about personal health problems and the like. Well, perhaps they're a LITTLE different - the HFers know they're operating illegally, so they seem to be a little more polite on the air so as not to ruffle any feathers. (1/2 :-))

By the way, the main reason I support no-code is NOT just because I happen to be interested in technical work and would like similarly minded people to join. That's only part of it. The REAL reason is that a no-code license is absolutely essential if amateur radio is to do the only thing that can possibly justify its existence much longer -- by interesting young people in science and technology. The FCC certainly doesn't think that 0.2% of the population have a god-given right to a disproportionate share of an important natural resource to ragchew and pursue what amounts to high tech stamp collecting simply because they've passed a code test.

Start thinking in terms of how the NON-amateur world views amateur radio, not in terms of how hams view ham radio. Remember that there are many more non-hams than hams, and they control all the frequencies.

Phil

Is there a bulletin board for people that just want to listen to foreign-country public radio stations? I have simple questions about which world band radio I should purchase, what's a good antenna (in particular, what's a good room antenna that doesn't transform my room into a cabling station), and what frequencies provide the best reception for, say German radio stations, in the LA area.

Also, are there intelligent radios that pick a signal off several frequencies, and use a DSP to extract noise and the common signal from these frequencies to get a clean signal?

OK, let's for a moment discard the remote/depressed areas where local hams probably don't have computers and probably aren't too interested in having someone issue a key so they can run their own rigs. Let's just consider this for places where hams DO have computers and DO want to "play the game" (which, naturally would include all the DXpeditions, since that's what they're out there for.) We don't have to replace ALL QSL cards, maybe we could just replace SOME of them.

|> [...] All
|> that would be needed for an award would be a list of stations worked

|> 73's --- VE5ZX (op syl) soon to be G0/VE5ZX
|>

An interesting idea that deserves attention, I'd be concerned about the effect on QSO rates and on the secondary effect of funds available to DXpeditions. (Lot's of people put in a little "something extra" in their QSL requests, but if you're no longer going to write off for a QSL, would they still be motivated to send a contribution? Another concern is motivation. DXers want those cards, but do the DXees ;-) have an equal motivation to get them out? Why should they invest in "instant QSL's"? I don't know the answer to that one.

My guess is that if you'd like to develop this idea, DXpeditions are the first place to look. They carry technology with them, so there's less of a problem with availability of machines to do the calculations, and since so many people want cards from them, there is the maximum benefit. If the DXCC desk would go for it, other awards programs might back it too. If a major DXpedition were to use the idea, probably many of the not-so-exotic stations would follow suite. Then we could exchange "DXCC numbers" the way they exchange "10-10 numbers" on 10 Meters.

There'd still be a need for cards though... I know I'd rather have the cards than the awards. As for the exotic locations -- they'll probably always require

cards. (And of course, now there's something else for old farts to wax nostalgic about,
"When *I* started in radio, we sent confirmations in the mail."
"Isn't that kind of stupid, given that you've got a radio?"
"No, we were better hams back then because of it. You kids today...."

>>>==>PStJTT
Patrick St. Joseph Teahan Taber

My employer doesn't care what I think. I, in turn, don't care what you think. You probably don't care what my empolyer thinks. Thus is life a circle.

>

Not true. The AEA DSP-1232 and DSP-2232 first production unit was delivered to my house last week. Notice I said PRODUCTION, that has nothing to do with the laboratory. While it is not available on the market yet, that will happen this fall. One of the `pre-conditions' Mike Lamb (prexy AEA) put on this was that I work out a weak signal mode for EME without $10000 worth of antenna. On terra firma paths, this is even easier as the coherence time is much longer (usually) than on EME paths. TAPR and AMSAT have their first Beta units to be delivered to software writers within the month. Tom Clark (W3IWI) and I STARTED the DSP in amateur radio hoopla in TAPR and AMSAT by DOING EME with Oscar class stations and DSP techniques based on software I wrote in 1986. My papers in the AMSAT and ARRL networking conferences haven't contained details of this work (intended for popular audiences). This will be the source of a great deal of detail in publication over the next year as I begin to work very hard to popularize and sell DSP as the solution to many of ham radio comm problems. It will also make specialty modes more affordable and encourage experimentation on weak signal modes that were not possible before now. Tom and I are working now on new modems for HF multipath dominated links, primarily as an intellectual exercise at this time, but leading to real working systems. All work at this time is on the Motorola DSP56001 and it is a very popular chip (and STILL available in cheap SLAMPAK regardless of rumors to the contrary). Ray Pettis recently published a scheme in QEX for using this chip and quite good clocks to get matched filters to bring signals out of the noise. He is not trying for the exciting 1 bit per second, otherwise inaudible links yet, but he COULD in short order. I emphasize, this is not the lab, this is people doing it on the air and will be available soon from dealers all over the world in working boxes.

There is not a single doubt in my mind that << so long as good clocks are available to your computer>>, DSP techniques will outperform CW+brain. In an emergency, etc., where you do not have access to extremely good clocks, CW may be the answer, but I will leave this for a future submission after I have returned to working on this particular problem as I am working on other

things at present.

223. Tower climbing safety

Newsgroup: rec.ham-radio
Date: 1990-08-07 15:05:43 UTC
From: eyg@hpnjld.HP.COM
Message-ID: <4140018@hpnjld.HP.COM>
Source record: 9428

I occasionally find myself doing antenna work atop guyed towers such as Rohn 25 or 45. While I feel quite safe once I am buckled in with a safefy belt, I keep thinking that there must be some simple devices that could make the climb up or down safer. Does anyone know of a commercial device that can prevent a person from falling off a tower during climbing? I'm thinking of something along the lines of a strong rope or wire that runs the length of the tower, which some kind of attachment to a safety belt. The attachement to the rope or wire would have to allow you to climb up freely, and maybe allow you to descend slowly, but grab if you tried to descend too rapidly.

> You know, it suddenly struck me - that the latest bunch of satellites
> don't handle CW. They don't even have CW beacons. Except FO-20, of
> course.
> - Brian

Brian:

While I TOTALLY agree with the sentiment, you must recall that LUSAT
(LO-19) has a CW beacon. Since the world (and the Argentinians) grew
tired of it, it stayed on the air about four months and was switched off.
THERE is cause for a small snicker. I suspect that pride, etc. will cause
it to be turned on occasionally. The only comments I have personally
received (by people who know my stance) is that they were unhappy it was
on since I had to reduce the power output of the PSK beacon to compensate
for the power used by the CW beacon ;-).

225. Re: TS-940 Fan Question

Newsgroup: rec.ham-radio
Date: 1990-08-07 15:09:11 UTC
From: alanr@tekigm2.MEN.TEK.COM
Message-ID: <9658@tekigm2.MEN.TEK.COM>
Source record: 9453

Just a fan note for TS-940S owners. Several 940 owners in the local area have had their original fans become extremely noisy after about 6 months of use on the radio. Probably because of shot bearings in the motor. We replaced the fan with a real EG&G Rotron unit, that is just super quiet and does a fine job. However this unit doesn't fit under the heatsink and must be mounted externally to the rear of the heatsink.

By the way there are two fans on a 940. The one attached to the power supply heatsink runs regularly, a few minutes on then a few minutes off, etc. There is another fan attached to the RF deck heat sink. This fan only comes on after a period of extended transmitting, such as during contests.

You'd think that for such a nice rig, Kenwood could put something other than a cheap $2 fan on the power supply.

Take care and 73,
Al Rovner, WA2TMP

>co-located stations). This is a HORRIBLE waste of spectrum just to save
>$10 per receiver.

Actually it is 12Mhz of empty space, second adjacent is the rule. Each
broadcast channel is 6Mhz. Second adjacent means two channels or 12Mhz.
Designing a fliter system that is very flat with 0.2 degree phase linearity
over a 6 Mhz bandwidth while having high rejection immediately adjacent
is neither simple nor cheap. Phase linearity is the key here as our
NTSC system depends on the color subcarrier phase to convey hue imformation
while depending on amplitude variation to convey saturation information
AND depends on both frequency and amplitude variation to convey luminance
information. NTSC is not technically the best way to transmit television,
but there is $50 BILLION dollars worth of equipment out there that depends
on it. There's no realistic hope of changing the system now.

>
>UHF stations should be able to operate much closer and even ADJACENT.
>

No, the same limitations apply to them.

>But what is really sad is that VHF and UHF TV is a primarily FIXED
>point-to-multipoint service, which is more suitable to spectrum above
>2 to 4 Ghz. FM radio broadcasting still tends to be mobile enough
>that it should not have to move up there. The appropriate usage for
>spectrum in the 30-3000 Mhz range is mostly mobile.

This sounds reasonable at first glance, however there are millions
of "portable" televisions in operation in this country. In addition,
if you think we have ghosting problems now, you have no idea how
much worse multipath becomes as you go up in frequency.

>
>Just think of what land mobile could do with 42 Mhz of VHF high band
>divided into 8400 5 khz channels and 336 Mhz of UHF divided into 13440
>25 khz channels (or 16800 20 khz) and trunked. I'd suggest 76-88 be
>used to expand FM broadcasting, and 54-72 could have many other uses.
>
>We just need to find a place to put broadcast TV way up there.
>I would certainly urge that HDTV *NOT* be allowed below 2 Ghz.

Ah the mythical HDTV! Don't hold your breath waiting for BROADCAST
HDTV. The economics just aren't there. My company participated in
the HDTV tests done for the FCC. We estimate it will cost between
$20 million and $50 million to convert a television station to
transmit HDTV. With an installed base of $50 billion in NTSC equipment
and NO original HDTV programming (except some old "I Love Lucy" reruns
that were shot on 35mm film--REAL HDTV) available to fill the hours, no
sane broadcaster is going to attempt the switch. You may see some
experimental HDTV on cable where the origination costs are lower,
but, until a large enough audience is equipped to receive HDTV, no
one is going to broadcast it on a regular basis.

My work is with W3IWI, KB2CST, KA2MOV, WA7GXD, AEA, ARINC, and DRSI.

All this stuff will explode from AEA, TAPR-AMSAT, etc. in the next few months and the adds WILL be in QST. Articles will be in several places but this will follow sometime after the boxes/cards are out due to the amount of time needed to do the actual work.

ajs@hpfcdc.HP.COM writes:
?It is a good idea, once you pass a test element, to attempt the next
?level, if time permits and the examiners don't mind. For instance, when
?I passed the Tech two months ago, 100% after thorough studying, I gave
?the General exam a shot with zero preparation -- and only missed it by
?two questions. If I'd passed it, I'd have had incentive to bone up on
?code and upgrade within a year.

I'll second that wholeheartedly. I took the Technician test while my
Novice license was still pending. The examiner suggested that as long
as I was there, I might as well take the test for General -- which I
passed, and then Advanced -- which I passed as well, and then Extra.
I got everything but the 20 wpm code, and made my first QSO as
KB9DLU/AA. Actually, I was operating a club station, and was therefore
W9YH/KB9DLU/AA... which is quite a handful to beat out in CW 8-).
The guy I contacted on 14.056 was quite surprised to hear that it was
my first QSO. 8-)

> again, I regret to say.

Oh yes, I forgot to comment on this statement. I agree that we were behind as a group in applying DSP technology to ham radio problems. HOWEVER, the multimode, all purpose, do it all DSP box is truly UNIQUE in its availability (or will be shortly) with open programming models, etc. I cannot think of another instance where this has happened and should have many groups in industry etc. wondering how those `damn hams' did it again. Some of the stuff we will be doing with DSP is not done ANYWHERE else and is too risky to be tried commercially. So long as ham radio continues to be a place where this kind of work can go on, there is a place for ham radio occupying the valuable spectrum it does. We are about to step to the forefront again in a couple of areas with comm systems based on DSP, etc. that don't exist elsewhere (commercially available, forget spooks, they don't count ;-).

This ability to do experimentation that is not `allowed' at work is the reason given over and over again by the KA9Q's, NK6K's, W3IWI's, WA7GXD's myself, and on and on (including WB6CYT if we ever get to sit down over that beer, I would be willing to bet) for their continued interest in ham radio.

That sounds more like it! Is there any comparison in the article to
how the signal sounded by ear?

This particular article didn't appear in the previously posted extraction
from someones online database. The title gives no clue that the DSP
application has anything to do with signal detection. What we really
need here is better titles. Might as well name every article in QST
as "Radio Stuff" :-)

I have scanned the specifications of the IC-R100 (from a brochure) and
the IC-R1 from my manual (which happens to be in English :-))

R1 Specifications
=================

o Frequency coverage:

VERSION FREQUENCY COVERAGE
U.S.A., Australia, Asia 100 kHz - 1300 MHz

Germany 13.95 - 14.5 MHz, 28 - 29 MHz,
144 - 146 MHz, 430 - 440 MHz,
1240 - 1300 MHz

France 100 kHz - 87.5 MHz, 108 - 1300 MHz

Specifications guaranteed
2 - 905 MHz.
o Selectable tuning
step : 0.5, 5,8,9, 10, 12.5, 15, 20, 25,30 or
50 kHz
o Number of memory
channels : 100
o Mode : FM, AM, Wide FM (WFM)
o Antenna impedance: 50 ohms (unbalanced)
o Power supply
requirement : 7.2 V DC (internal battery)
Optional BP-81 - BP-85 or BP-90
External DC power 6 - 16 V DC
o Current drain : Max. audio output Less than 300 mA
Power saved Average 15 mA
Duty cyc le Receive: Standby = 1: 16
o Usable temperature
range : -10C - +60C; +14F - +140F
o Dimensions : 49 (W) x 102.5 (H) x 35 (D) mm
1.9 (W) x 4.0 (H) x 1.4 (D) in
(projections not included)
o Weight : 280 g; 9.9 oz
o Receive system : AM, FM Triple-conversion
superheterodyne
WFM Double-conversion
superheterodyne
o Intermediate
frequencies : 1st 266.7000 - 266.7095 MHz

2nd 10.7000 MHz
3rd 455 kHz (FM/AM only)
o Sensitivity : AM (for 10 dB SIN)
1.6 uV (2 - 24.9995 MHz)
0.79 uV (25 - 905 MHz)
FM (for 12 dB SINAD)
0.79 uV (2 - 24.9995 MHz)
0.4 uV (25 - 905 MHz)
WFM (for 12 dB SINAD)
6.3 uV (2 - 24.9995 MHz)
3.16 uV (25 - 905 MHz)
o Squelch sensitivity : AM 1.26 uV (2 - 24.9995 MHz)
0.63 uV (25 - 905 MHz)
FM 0.63 uV (2 - 24.9995 MHz)
0.32 uV (25 - 905 MHz)
o Selectivity : AM More than 15 kHz/-6 dB
FM More than 15 kHz/-6 dB
WFM More than 150 kHz/6 dB

o Audio output power : 150 mW at 10% distortion with an 8 ohm load

o Audio output
impedance : 8 ohms

All stated specifications are subject to change without notice
or obligation.

R100 Specifications
==========

o Frequency coverage:
Version Frequency Coverage
U.S.A.. Europe 100 kHz-1856 MHz*
Australia

13.95 - 14.5 MHz,
28 - 29.7 MHz.
Germany 144 - 146 MHz.
430 - 440 MHz,
1240 -1300 MHz

0.1 - 87.5 MHz,
France 108.5 - 1856 MHz*

*Specifications guaranteed 500 kHz - 1800 MHz

o Mode : AM, FM, wide FM
o Power supply requirement : 13.8 V DC + 15% (negative ground)
o Antenna impedance : 50 ohms (unbalanced)

o Current drain (at 13.8V DC) : Less than 1.1 A

o Usable temperature range : -10C - +60C; +14F - +140F

o Frequency stability : +/- 3.5 ppm (at 1800 MHz, -10C - +50C;
+14F - +122F)

o Number of memory channels : Memory channels 100
Priority channels
Scan edge channels 20
(for 10 scan ranges)

o Tuning step increments : 100 - 521.5 kHz and 1.630 - 904.9995 MHz
1, 5, 8, 10, 12.5. 20 or 25 kHz
522 - 1629.5 kHz
1, 5, 8, 9, 10, 12.5, 20 or 25 kHz
905 - 1856 MHz
12.5, 20 or 25 kHz

o Dimensions : 1 50(W) x 50(H) x 181 (D) mm
5.9(W) x 2.0(H) x 7.1(D) in
(projections not included)

oWeight : 1.4kg; 3.1 Ib

o Sensitivity : Maximum sensitivity values are indicated in
each range below. Preamp is ON in 50.000
-904.9995 MHz.
Wide
Frequency AM (1) FM (2) FM (2)
Range
500 kHz - 1.6295 MHz 3.2 uV --- ---
1.63 - 49.9995 MHz 1.6 uV 0.56 uV ---
50 - 904.9995 MHz 0.56 uV 0.2 uV 0.63 uV
905 - 1380.4875 MHz 1.0 uV 0.32 uV 0.79uV
1380.5 - 1800 MHz 1.4 uV 0.45 uV 1.1 uV
(1) For lOdB S/N (2) For 12dB SINAD
--- : Not specilied.

o Selectivity : AM More than 6 kHz/-6 dB
FM More than 15 kHz/-6 dB
Wide FM More than 180 kHz/-3 dB

o Audio output power : More than 2.5W at 10% distortion with an
8 ohm load

o Audio output impedance : 4-8 ohms

All stated specifications are subject to change without notice or obligation.

A couple of notes from me
==========

In the UK the R1 costs 399 GBP and the R100 499 GBP.

The R1 also has 20 scan edge channels and a priority channel; the
priority mode can use either a single channel or a a range of channels
choosing the next channel every time it checks.

The R1's sound is very good considering how small the speaker is. In a quiet room with the volume turned up, it is quite acceptable listening from the other side of the room.

The R1 seems to receive very well over 905 MHz but is the only radio I own that covers, but cannot pick up, BBC Radio 4 on longwave (198KHz)! I assume that this is because I have only used the supplied VHF/UHF antenna; however it can pick up a station nearby :-(

I hope that this is of some use

Kevin

-I just purchased a LORAN-C for my 32' sloop. It also has a Yaesu
-FT107M ham radio HF tranceiver aboard, connected to a heli vertical.
-
-I'm a bit worried about how the LORAN equipment will handle 100W of
-RF being radiated 6' from its antenna/coupler... currently I
-disconnect the LORAN whenever I use the ham rig; am I being
-excessively paranoid?

-Pontus Hedman rph@sq.com {uunet|utzoo}!sq!rph

My LORAN-C (an mi-3000 locator model) didn't take too kindly to me transmitting
~50W of ATV (429.25 MHz) about 2 feet from it's antenna. It got very lost,
but sustained no damage. I'm thinking of sticking a high-slope low pass filter
in line with the antenna, with a cutoff of about 1 MHz, just to see if it'll
help. My 10 and 2m rigs (25 and 5 W, respectively) seem to have no effect.
The LORAN, however, messes with my 10m rig. Lots of cpu and switching noise.
Your mileage may vary.

Interesting idea. But the RST/RS is not a good base for the input...
All DX contacts are 59 !! Especially in contests. The band/time/freq
and call would be a much better idea. However, during the heat of
a contest where some of the serious contesters are concerned about rates,
the time to generate the unique number may not be acceptable. Even
some of the DXpeditions operate in a contest mode. Just some random
thoughts. But I like the idea, since it is sometimes quite hard to get
a card to a DX station or get the card back.

OK, so CW is "relevant" if you're going to operate in the "weak signal
portion of the band." Now please explain why it is "relevant" to GETTING
A LICENSE in the first place. After all, I'm currently LICENSED to use RTTY,
but I didn't have to pass a typing test.....

> If they want to "communicate" then they will keep Communicator class
> licences, if they want something more then they should get a class
> of licence which is intended to do more.

From the NPRM, (The FCC quoting the ARRL).

The ARRL states that its suggested name "Communicator", although
"not exaclty reflective of the type of license envisioned in the
proposal ... is, however, the most descriptive among the alternatives
considered".

Even the FCC knows the name is misleading.

)It would go a long way toward building a strong HAM fraternity.

Fraternity, I don't want to join some stinking fraternity. All
I want to do is sit in my basement and build things that go Beep,
not join some lodge with its strange rituals and hazing. But
the regulations say that if I want to build a transmitter bigger
than 1 Watt, I either have to have a serious amount of money or
be a ham.

How would you like it if the Elks lodge owned Yosemite National
Park and restricted it to members only.

]>100W ERP (not unreasonable power), we are looking at +50dBm. So,
]>take your 100 dB of isolation, and you are looking at -50dBm of
]>noise into your narrow receiver. That's a LOT of power! As I was
]>pointing out, you need a large amount of isolation.
]
]Wait! Of that +50dbm of ERP, how much is out-of-band? My impression
]of SS is that we are required to keep intentional radiation inside
]the band. Therefore the only power that can pass into the out-of-
]band narrow receiver is that small percentage of the total transmit
]power contained in spurious responses that happen to be within the
]passband of the narrow (20khz) receiver. Therefore simply subtracting
]and getting -50dbm doesn't seem to be valid.
True... subtract another 30 dB for spreading. Still at -80 dBm - still
lots of noise. As far as keeping radiation in-band... that's my whole
point: that it is hard to do without expensive filters.
]
]Also SS on 2m? I guess I need to reread the rules, I thought SS
]had to be 420Mhz and above.
Oh well... I was talking technical. Forgot the rules. However,
same applies to 440.
]
]>]desense or intermod to the narrowband equipment. We did wind up
]>]adding a cavity to the output of the modem, but that was because
]>]the narrow band equipment was desensing our modem enough we couldn't
]>]copy a weak signal from one of our other modem links.
]>]
]>Specifically, 70kHz is narrow enough to allow running it through a
]>cavity, which you did. That adds a lot of isolation. In fact,
]>running 56 kB through 70 kHz is nowhere close to "spread spectrum" -
]>you are running slightly over one bit per Hz. I would expect
]>real spread spectrum to be way down from that.
]
]Reread what I said. We added a cavity later because the narrowband
]equipment was bothering us; not the other way round. I agree that
]real wide spread spectrum should have even better characteristics.
Yes, but you were trying to give an example of a case where SS
went through a cavity, and I was just pointing out that the
example was inappropriate.

On 4 Aug 90, brian@ucsd.Edu (Brian Kantor) said:
-
- Do any of the Volunteer Examiners allow people to take the rules or
- technical elements of the exam BEFORE you've passed the corresponding
- code tests? Around here, you have to get past the code before they
- will let you take a crack at the written parts of the exam.
-
No problem whatsoever. In May, with a form 610 and a copy of my
trusty Novice ticket, I went to an exam session given by the Brazos
Valley ARC and wrote Elements 3A and 3B. They sent my 610 to the FCC
and issued me credit for 3B. I did not even attempt Element 1B [13wpm]
so I still have to pass that element to upgrade to General. However,
I _only_ need the code [for another 9 months or so.] To reiterate,
no problem whatsoever - atleast here in Houston.

Note, however, that I did have to pass Element 3A before I could
write the exam for Element 3B, but that has nothing to do with Morse
code. I would suggest you politely ask the VEs in your area if they
perhaps misunderstood the FCC rules regarding this.

I've power-charged NiCads by hooking them up to a garden-variety power supply through a low-value resistor (e.g. 1 ohm). By using a voltmeter across the resistor, you know the current. Adjust the resistor until you get 80-100 mA. Note that P=I^2R, so don't blow up your resistor.

Note that 80-100 ma for 16 hrs is about 1.3 mA-hr, so if you are impatient, you could presumably charge it at 1.3 amps for 1 hour instead. I usually am, so I charge to 80% capacity, then put it on trickle to top it off.

> That is my tech license.

Oops. :-) Guess you're stuck now where I am.

> BTW, you were hitting the .310 machine real nice from Crystal Peak...

Uh oh, I'm getting [in]famous. Yeah, I was surprised that particular repeater worked better for me than all the others in the Colorado Connection:

Distances (miles) from Crystal Peak (13852)
8 147.015+ Breckenridge (Bald Mountain, 13684') APPROX
11 145.445- Leadville/Fairplay (south of Mosquito Pass, 13240'+)
** 49 145.310- Denver/Boulder (NE Thorodin Mtn = Starr Peak, 10511')
50 145.400- Denver (Mount Lindo, 7814') APPROX
69 147.285+ Salida (Methodist Mountain, 11655')
80 146.910- Colorado Springs (Woodmen/Union jct, 6460') APPROX
81 145.355- Parker (junction at 5850' + 9 miles east) APPROX
85 448.500- Colorado Springs APPROX
98 147.285+ Rifle (West Anvil Point, 8680'+) APPROX
135 449.300- Cheyenne, Wyoming APPROX
146 146.730- Walsenburg (North Rattlesnake Butte, 6439')

I could hear a lot of the repeaters but only work a couple of them.

> (why isn't it called peak 11?).

I don't know why they named ten peaks as Peak 1 through Peak 10, north to south (allowing that Tenmile Peak is Peak 2), and then started calling them Crystal, Pacific, and Fletcher.

Anyway, Peak 10 was a wonderful place to watch the sunrise (and play radio) last Saturday. Crystal was on the way to Pacific...

> ... But don't expect it to have any claim on either the
> input or output frequency! If I want to carry on a simplex conversation
> on the input frequency, using the repeater's PL, that is my right!

To which tad@ssc.UUCP (Tad Cook) replied:
- Ohhhhhh......I don't think so! This has been tried during some of the
- "repeater wars" in Southern California, and believe me, the simplex
- operators were cited!

Huh? John Moore said "using the repeater's PL" which implies to me
that he was using the repeater. No? If a properly licensed amateur radio
operator USES a closed repeater, what FCC regulation is she/he violating?
If this is an FCC violation, something is very wrong.

But montague@npdiss1.StPaul.NCR.COM (John Montague) claims:
-
- Such an action, if it can be shown that you know that you are using the
- private repeater's PL, would be willfull and malicious interference; an
- action prohibited by FCC regulations.
-
? ? ? ! ! ! Please explain how using a repeater can be considered
willfull and malicious interference. If someone else was talking on the
repeater and I stomped on them, then that would be a violation. However,
if like most private repeaters, it is not being used, then I fail to see
who I am causing interference to. Maybe I'm a fritter-head, but I don't
understand. Could somebody please explain this? Please cite the applicable
FCC regulation too. By number. TNX

Nothing is free. The tradeoff in this case is a couple of hundred dollars worth of signal processing parts or three months of your time memorizing Morse. And the signal processing stuff will still out perform the trained ear in the end.

This may be true on paper, but in practice, amateurs >use< CW (and phone,
and packet). One has to build up a clientelle for anything else, and
>that< is the real challenge.

We're working on it... it's called anti-irrelevancy-licensing, more
conventionally known as "no-code".

> of the USER's must be considerd in coordinating decisions.

The USER's, which also include potential operators of newer repeater systems,
definitely have a vested interest in how the spectrum is used or wasted.

The FCC would be in a terrible position of taking away our frequencies
just because of the low density of repeaters *IF* we indicated that we
COULD have made use of the spectrum had they let us.

> So, if someone wants to cause trouble (or maybe even do some good,
> although I don't generally like such tactics), they can set up a
> competing coordinating body that refuses to recognize the closed
> repeaters. If they are clever, they will appeal to the USER community (which,
> of course, does not have a large percentage of closed repeater users) and
> maybe win FCC recognition OVER the old coordinating body.

One could TRY to work things out from the INSIDE. But that is very difficult
with organizations that restrict their membership to owners of coordinated
repeaters. The savvy coordinating group will open up its membership to all
amateurs.

> As the need for frequencies gets more intense, more of these disputes
> will arise. Today, there are many frequencies, throughout the country,

> band congestion)? Where do they get the frequencies? How about
> digital modes (packet, digital voice, TDMA digital voice, etc)?
> Why should almost all frequencies be tied up so that these private
> groups can occasionally use a quiet FM frequency?

There is of course the CURRENT 220 problem. Assuming the FCC decision to take away 220-222 Mhz is not reversed, which is a distinct possibility, the remaining 3 Mhz needs to still be shared. But the question is how to share it. Are we going to take away 40% from each type of usage across the board? What will coordinators tell repeater owners? Will we have 40% fewer repeater channels or will we reduce the channel spacing (which might be hard since I understand SOME 220 Mhz are stuck on 20 khz spacing). Are there any groups who demands on the spectrum will go down?

This situation might actually force us to learn, as a group, how to make better use of spectrum. If we take advantage of the learning, we can also make expansion of the who amateur service work, and perhaps save most of the rest of our spectrum.

I don't quite agree. While it may not be good operating practice, and may
even be eligible for NOV on that grounds, it is not interference unless some
other communication is actually interefered with. Simply arranging to
carry on a simplex QSO in such a way that a repeater will play it out for
all to hear on another frequency is not interference. If that repeater
has an ongoing QSO, then it is. If that repeater's output is interfering
with something else, and IF YOU KNOW THAT and operate anyway, again that is
interference.

First thoughts might be to suggest using heavy duty tubing, and make a
slot antenna. Feed it from the inside, vertically, and seal it up tight.
I've never tried it... it's just a thought off the top of my head.

255. More TVI Problems

Newsgroup: rec.ham-radio
Date: 1990-08-08 03:23:44 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880243@hpfcdc.HP.COM>
Source record: 9452

I need help from any of the RFI gurus on the net. I am getting into my TV and VCR big-time. Any suggestions are welcome. Please save my marraige - my wife likes TV, and I like ham radio. :-o

Channel 2 and Channel 6 (2nd and 3rd of 28 Mhz, 4th/6th of 14 MHz) are affected (crosshatching), even at 100 watts. The picture is adversely affected with or without the VCR connected. I've installed a low-pass at the xmtr, and a hi-pass at the TV. The TV stations are 50-60 miles away, so I may be fighting the fringe.

The antenna is a ground mounted vertical with a reasonable (24 radial) ground plane. The TV/VCR is located at the other end of the house, about 40' away. The TV antenna is also about 40' away and 30' up, and certainly in the field. Transmitting with 500 watts is right out - the picture is severely affected. If I transmit into a dummy load, the TV is clean, even at 500 watts, so I'm not getting in via 120 VAC. I think this also means the trasmitter is reasonably grounded.

I have heard about replacing the TV antenna with a 75 ohm resistor - this will determine if the TV is picking up TVI via the antenna or via poor shielding at the set. As I recall, I tried this (the attic is a jungle of fiberglass), and got no interference.

The question now becomes one of eliminating the TV antenna as the culprit - corroded metal diodes and all that. It is very dry here, and the antenna has been in the attic for 10 years, so corrosion is unlikely. How do I tell ? And if it isn't the TV antenna, how do I find the source of the harmonics ? The set has some funky rabbit ears - I'll see what they do when I finish typing this in.

Yours for better neighborhood relationships,

Perry Scott

```
> A scanned PostScript copy of the English R1 manual is now available via
> anonymous ftp from wilbur.Stanford.EDU (36.14.0.30). The manual was
> scanned into TIFF format by kpt@doc.imperial.ac.uk, and was munged into
> .ps using the pbmplus toolkit. Share and enjoy.

The path to the file is pub/R1.tar.Z

For those of you using BSD UNIX or close enough compatibles, one command
can snarf it up and make the R1/*.ps files directly:

echo 'user anonymous yourid@your.host\
binary\
get pub/R1.tar.Z "|zcat|exec tar xvf -"\
quit' | ftp -nv 36.14.0.30

The uncompressed files tape up 4.4 megabytes of space. The compressed
file is only 600 kilobytes.

The "exec" in the above command reduces your swap space demands by have
one fewer process sitting around doing nothing (the shell that ftp starts
to invoke the pipeline). Some systems have a smarter shell that will do
this for you anyway, and some others have a dumber shell that won't at all.

Quoted from the telecom digest/newsgroup:

From: contact!ndallen@uunet.uu.net (Nigel Allen)
Newsgroups: comp.dcom.telecom
Subject: Coastal Telegraph Stations
Date: 8 Aug 90 00:39:00 GMT
Sender: news@accuvax.nwu.edu
Organization: Contact Public Unix BBS. Toronto, Canada.

Before INMARSAT began to provide satellite radio service to ships at sea, the only way to send a message to a ship was through a coastal radio station, either by voice or by telegraph. (I think that teletype service was available through Rogaland Radio in Norway, but not in North America.) INMARSAT is quite expensive ($12 per minute from Canada), but even so coastal radio stations are closing down in the U.S.

{Popular Communications} Magazine reports that Western Union has filed with the FCC to shut down its coastal telegraph station KFS (location unspecified), and that some other coastal telegraph stations, WPA, WOE, WMH, WSL and KOK (locations and owners unspecified) have already been closed down.

I tell people to *always* take all the tests they can. This means take all the written tests up thru extra until you don't pass one. You might surprise yourself! It doesn't cost any more. As for the code, try the 20 and then the 13 too before dropping down to the 5. Even if you flunk the other two, you can take the 5wpm. Again, you might surprise yourself. Or just consider the faster tests to be a warmup. This helps get you familiar with the testing process, the code tapes they use, etc. If all you expected to get was 5wpm, by the time you heard 20 and 13, 5 will be a piece of cake.

259. Re: English R1 Manual available via anonymous ftp

Newsgroup: rec.ham-radio
Date: 1990-08-08 09:01:35 UTC
From: kjh@pollux.usc.edu
Message-ID: <26483@usc.edu>
Source record: 9392
Cross-posted to: rec.ham-radio,rec.radio.shortwave

After reading this R1 manual, I failed to spot any "delay" function, whereby an extra delay can be added to a simplex frequency, or a frequency with a repeater with a short hang time, so scanning won't resume until a response is heard. Does the R1 or the R100 have a delay function?

I also note the lack of "banks" for scanning, although you can set the lower and upper memory channel to scan between, effectively having 1 bank.

Icom may have done something significant in producing a very small wideband receiver, but they have ignored things that other manufacturers have learned concerning the user interface. I think they should be faulted for this. There is no reason that this scanner can't have these very useful features, probably just by re-writing the firmware.

If Icom is planning for a future model with these features, or more memories, then I think they should be faulted for this also. They should just do it right the first time, corner the market, and take their profits right away. I'm a poor student, and although I would like such a receiver, even as it is, I can (and will) wait until something more to my liking comes out. :-)

Thanks to all for your comments, Repeater jamming etc all seems very tame
over here in the UK compared with state-side.

>Repeaters are not operated by private individuals here; they are run and
>maintained by local repeater groups (who hold the license for repeater
>operation). We dont have that many repeaters either (there are only 7 channel

However it may not be quite as much a free for all as it appears. Here in
Central Scotland the repeater group manages 3-4 repeaters on 2 metres.
The publish a membership list and actively discourage others from using
the repeaters except for visiting amateurs to the area. The idea being
that only those who contribute to the running of the repeaters should
benefit from them. Also the repeater group is under funded, so it wants the
free loaders to cough up some bread.

DOVE, the Digital Orbiting Voice Encoder microsat seems to be steadfastly back on 2m now. But the telemetry packets have two fewer channels than before. Does this mean that the whole set of telemetry channels has been changed or reorganized or that just the last two (related to the S-band xmtr) have been dropped? Also, is there a new set of telemetry equations to go along with the new format? There appear to be more non-zero values in the status bits now too. Is there an up-to-date description of what they all mean? Many thanks in advance for any help anyone can offer.

266. GETTING ON FREQ (Precisely)

Newsgroup: rec.ham-radio
Date: 1990-08-08 15:00:00 UTC
From: gene@uicsl.csl.uiuc.edu
Message-ID: <29400005@uicsl.csl.uiuc.edu>
Source record: 9463

How about a campaign
to suggest how all "phone nets" can get on "precisely" the same frequency, inde-pendent of an individual's "taste" in tuning in a signal.
My suggestions are based on the assumption that the large majority of transceivers are digital/synthesized, read only to 0.1 Khz on the main display, and have the option of tuning in exactly 1 Khz steps where it necessarily stops "precisely" on a full digit. My Icom 751 does this and I feel pretty sure that other similar equipment does the same.
1. Have all nets agree to use a "full" digit (no 0.1 Khz fractions).
2. Have all participants leave their main tuning in the "1 Khz-step" mode only, to step to the desired digit.
3. Henceforth, DO NOT TOUCH the main dial....use only RIT (Receive Incremental Tuning, or whatever descriptive term is used).
Thus each person can set his RIT to suit his own personal taste with only one setting and everyone will automatically suit "his ear"!
Of course all the above depends on the transceiver being precisely calibrated to WWV, and I suggest the following:
1. Using the same 1 Khz-step mode only, set WWV upper-sideband on VFO A, and WWV lower-sideband on VFO B so that you can quickly toggle between them. BE SURE to have your RIT off, or cleared to zero!
(Alternately, for quick, easy check, I set WWV 5Mhz in Memory-channel 1 & 2, 10 Mhz in 5 & 6, 15 Mhz in 9 & 10, using the gaps between sets so as not to accidentally toggle WWV on two different frequencies, since the transceivers are not absolutely perfect)
2. Now wait for WWV to send their "musical tone" (not preset during some intervals), and simply "tweak" your calibrator until your ear tells you that the two musical tones match, as you toggle quickly between upper and lower sideband. I feel certain that almost everyone has a good enough "ear" to recognize when the tones match!
By the way, if you thought you were good at tuning in speech perfectly..try first "tweaking" your calibrator until you think the voice sounds natural (do this before the tone test)...then use the comparative-tone test and see how many Hz you missed.

]Actually it is 12Mhz of empty space, second adjacent is the rule. Each
]broadcast channel is 6Mhz. Second adjacent means two channels or 12Mhz.

This is true for VHF, but not for UHF. UHF has at least 3 empty channels
between each station. Here in Phoenix (population > 2 million), it has
6 empty channels each. In addition, harmonic and intermod relationships
cause additional channels to be set aside. This IS a big waste.

]Designing a fliter system that is very flat with 0.2 degree phase linearity
]over a 6 Mhz bandwidth while having high rejection immediately adjacent
]is neither simple nor cheap. Phase linearity is the key here as our
But it really isn't that hard to do for rejection with ONE guard channel
on each side, which would greatly reduce the waste of UHF spectrum.

I should also point out that an experimental license was issued to
at least one company that transmits data on ADJACENT UHF channels.
Their trick: they only transmit during the sync pulses from the adjacent
station, at which time the TV is tens of dB less sensitive to interference.
A neat (and patented) trick, IMHO.

]>But what is really sad is that VHF and UHF TV is a primarily FIXED
]>point-to-multipoint service, which is more suitable to spectrum above
]>2 to 4 Ghz. FM radio broadcasting still tends to be mobile enough
]>that it should not have to move up there. The appropriate usage for

Re: The rest of the world.....

You know, some things don't change much.

In the newest issue of OFF-ROAD magazine they have an article about
CBs, CB antennas and stuff. They have some cute things on antenna testing
but what strikes me as funny is:
(1) They show a picture of a fellow's truck and specifically mention his
150 watt linear. (Guess I'll have to copy the article and send it
to Uncle....)
(2) They have a very nice sidebar describing a top-of-the-line Midland
CB with SSB capability. They go on to mention how SSB is FM and
how FM SSB is so powerful and quiet. :-)

When I was in college I had a friend, WB4DBB, who fixed radios for a
living. He had stories about CBers and their "joltmeters, omenmeters"
and the guy who was driving around with 50 gallons of saltwater in
containers in his trunk because he'd noticed he got bettter range
from the CB in his boat........

Now, back to your regular discussion of non-technical licensing :-)

Ron
NW0U

(I was interested in CB for awhile but I got over it with ham radio.)

I certainly agree that we need some means of "confirming" QSOs that would cost less money and effort (and frustration!).

The solution you describe in which encryption is involved is illegal in the United States -- no encryption on the amateur service. (Albeit the 'Q' signals seem a bit cryptic, they are internationally recognized.)

As the other responses point out, many of the DXpeditions/major contests have the computing power with them. Could the League or some other clearinghouse make disk copies of their logs? A fee (annual?) could be paid to the League/clearinghouse to supply you with your 'award status' -- which you could use in place of (or in conjunction with) QSLs when submitting for DXCC, WAZ, etc. Of course, if the League handled it, they could immediately see your DXCC status and mail you the appropriate certificate/endorsement!

The R1 has two scan continuation modes; the default is t-10, where scanning
continues after ten seconds of channel carrier. The other mode (which I use)
continues scanning after the carrier drops AND two seconds pass (p-02).
So, it does indeed have a delay function.

>Kirk Baxter, N0FPZ

I just purchased the DR-570T also. This has got to be the most
full-featured dual-band mobile on the market. I am impressed with the unit,
not so much the user manual. A service manual is available from Alinco for
10 bux.

There are many undocumented features especially in the "repeater mode".
Alinco claims that you can ONLY repeat from the VHF VFO to the UHF VFO and
vice-versa. No PL or CTCSS decode or offsets..... wrong! (pleasant
surprise!). You can repeat from memory to memory or vfo to memory, CTCSS,
PL, and offsets can be included. The DR-570T has DUAL CTCSS decoders and
encoders (a paid option on the new upcoming DR-590T)! Also, all of the
usual panel controls are live while in repeat mode so you can change
paramaters while in the active repeat mode.You can also pick up the mike
and join in on the QSO in progress!. Even the up-down buttons are still
functional making remote control with a homebrew DTMF decoder a reality.

As far as out-of -band enable, just pull off the top cover, place the radio
with the knobs facing away from you. Locate the logic board behind the
front panel. Towards the top middle of logic board (in the unsheilded area)
are three white color jumpers, the one on the left tilts about 45 degrees.
You want to cut the last jumper on the right (about mid-front panel).
Replace the cover. Turn on the radio with the Function key depressed. The
rig will now have to be re-programmed. Frequency range Rx and Tx :
130Mhz-170MHz, 420Mhz -470MHz. Rx only: 335-385 MHz and 850 Mhz to 890 MHz.
No re-alignment is needed for these ranges. Power out is about 15-20 watts
at the extreme edges on UHF with receive sensitivity dropping off to no
worse than about 1 microvolt at the edges. I didn't measure VHF yet...

I questioned how questions about what element designators (1a, 3b, etc) are required for what lisence would help ensure legal operation of your extra class station (the supposed purpose of the legal section of the exam).

Several people pointed out that one of the priviledges of the Extra was to be a VE, so you should know these things. I just got my 610 in the mail yesterday, and all of the elements required for each class are printed right on the form. Since it is apparently impossible to excercise the VE priviledge without someone handing you a 610, I say again: Is there any point to memorizing yet another list?

How about the new system of emission designators, when right in the ARRL edition of the rule book they say that the fcc has gone to english descriptions because the designators are too restricting, and really pretty pointless anyway.

Again, I am not saying "They shouldn't ask these because they are too hard," I am saying they shouldn't ask them because they are useless, and they displace questions that could be more relavent.

I suppose I should really be venting this steam towards the ARRL. Maybe after I take the test.

As a licensed amateur radio operator who has successfully passed a five word per minute morse code telegraphy exam in order to get my operator license, I can tell you that the PK-232 can copy morse code off the air much better than I can.

So tell me, did the code test do me any good?

Did it accomplish the purpose increasing my operator skill?

What it did accomplish was keeping me out of ham radio for 18 years.
And for most of that time I had subscriptions to 73 and HR magazines.

After reading the ARRL Technician Class license manual and looking at
the test question supplement to be used for the question pool after
July 1, 1990, I am completely confused.

==========

After reading chapter 8, "Signals and Emmissions" I came across the following:

F1B - Telegraphy using frequency-shift keying without a modulating audio tone
(FSK RTTY)

F2A - Telegraphy produced by then on-off keying of audio tone fed into an FM
transmitter.

F2B - Telegraphy produced by modulating an FM transmitter with audio tones.
(AFSK RTTY)

3AH-2-3.2

Page 10-44
What is the emission symbol for telegraphy by frequency shift
keying without the use of a modulation tone ?

A) F1B B) F2B C) A1A D) J3E

After 7/1/90
Page 10-62
What is the emission designation for telegraphy by frequency
shift keying without the use of a modulation tone ?

A) RTTY B) MCW C) CW D) Sideband phone

Answer is A.

-?) What is MCW ?? Is it modulated code wave ??? Why is F2B designated as MCW
when F2B is AFSK RTTY ??

3AH-2-4.1

Page 10-44
What emission type results when an on/off keyed audio tone is
applied to the microphone input of an FM transmitter ?

A) F1B B) F2A C) A1A D) J3E

After 7/1/90
Page 10-62
A) RTTY B) MCW C) CW D) Sideband phone

Answer is B.

-?) Now I'm really confused, why is F2A now MCW ?? Is MCW F2A ???
Is the answer correct ??

3AH-2-4.2
Page 10-45
What is emission type F2A ?

A) Telephony produced by audio fed into an FM transmitter
B) Telegraphy produced by an on/off keyed audio tone fed into
an AM transmitter
C) Telegraphy produced by on./off keying of the carrier
amplitude
D) Telegraphy produced by an on/off keyed audio tone fed
into an FM transmitter

After 7/1/90
Page 10-62
What is tone-modulated international Morse code telegraphy ?

B) Telegraphy produced by on/off keyed audio tone fed into a
CW transmitter.
Answer is D.

-?) Is this MCW ??

3A-2-5.1
Page 10-45 What is emission type F2B ?

A) FM telegraphy using audio tones
B) FM telphony
C) FM facimile using audio tones
D) PM television

After 7/1/90
Page 10-62 What is the emission designated as "MCW" ?

Answer is A.

???? I thought this was AFSK RTTY ??? Should A) be "FM telegraphy using
on/off keying of an audio tone ? " Or should the quesion be what emission
designates AFSK RTTY ??

3AH-2-5.3

After 7/1/90
Page 10-63 What emission type results when an AF shift keyer is connected
to the microphone jack of an FM phone transmitter ?
A) SS
B) RTTY
C) MCW
D) Image

Answer C.

??????? I thought the answer should be B, any explanations ???

I guess the question I am asking is:

1) What is MCW ??
2) Is MCW = AFSK RTTY = F2B ??
3) What is FM Telegraphy using on/off keying of an audio tone fed into the
input of the microphone ?.

==========
Chapter 3 "Radio-Wave Propagation

On page 3-2 it states that:

As radio waves pass through the ionosphere, they give up energy. This sets
some of the ionized particles into motion. Effects of absorption on lower
frequencies are greater than on higher frequencies. Absorption also increases
proportionally with the amount of ionization. The more ionization, the more
energy the radio waves lose passing through the ionosphere. Absorption is most
pronounced at midday. It is responsible for short daytime communications ranges
on the lower amateur freqencies (160,80, 40meters).

On page 3-6 it states that:
Maximum ionization occurs during a sunspot cycle peak. High sunspot numbers
usually mean good worldwide radio comunications....

????? If absorption is proportional to the amount of ionization how could
you get good long distance communications during a high sunspot number
when ionization is at maximum ?????

If anybody can explain answer these questions please reply or post on notes.

Thanks in advance,

Ham in training,
Mel

I have been following the thread about DSP technology allowing much weaker signals to be copied than is possible with good receiver + CW + human ear. It is not clear to me why similar technology can't be applied to CW signal detection in order to allow the reception of even weaker signals than is currently possible. Am I missing an important point about the nature of the computer-generated signals that are currently being picked out of the noise by DSPs that makes application of this technology to CW signals inappropriate?

-Just wondering

>too rapidly.

> Ed Gilbert
> WA2SRQ

Rohn makes such a device for commercial towers. It consists of a
cable that runs up one of the legs from top to bottom supported by
posts that hold the cable about 1" out from the leg. You clip a
device to the cable when you start up and it runs along as you
climb; however, if you fall, the device will lock.

This is something the tower owner must install, it isn't something
a tower climber could temporarily install.

My friend uses a short length of chain with a hook on the end that
he moves as he clibs. I find this gets in the way and that I am a
safer climber if I just do it free style (I think you will find that
most pro's do not attach themselves until they get to a fixed location).

>experimental HDTV on cable where the origination costs are lower,
>but, until a large enough audience is equipped to receive HDTV, no
>one is going to broadcast it on a regular basis.

Your company's analysis was SERIOUSLY flawed. It sounds like the arguments
against CD's, rehashed. Remember, there was "no installed base" for CD's
because "there are no disks to play". Many people would move up to HDTV
(real HDTV, not the low-res stuff the FCC says they MAY allow) receivers
to take advantage of the higher display resolution, even on less than full-
screen, for laser disks (which are coming back), S-VHS tapes, and computer
displays. Heck, what was the installed base for TV in 1940? Couldn't we
have saved that bandwidth for radio (commercial, military, amateur, etc)?

Why not reallocate the UHF band? Retain, say, channels 14-59 for NTSC
and reallocate 60-88 for FULL-BANDWIDTH HDTV, adjusting the spacing as
required. The channel conversion costs, including promotion/information
to inform consumers of the change, could be subsidized from the license
fees payed for the new HDTV channels. The gov't could sell bonds financed
by the license fees, and perhaps, an excise tax on HDTV receivers. This way,
the relatively small cost to change the broadcast channel isn't a burden
on small stations, and the current investment in receivers isn't obsoleted
overnight. As the demand for HDTV rises, additional UHF bandwidth could be
reallocated. Commercial stations might even "simulcast" on NTSC and HDTV
like they (used to) do on FM-AM. Probably using lo-res sources initially,
but later using hi-res sources, converting down to NTSC.

As for the lack of programming, there are already HDTV setups for live
sports. Live and taped concerts, especially pop, would sell commercial

time well. And picture 70MM movies broadcast over HDTV, which also has hi-fi sound!! Other programming could be broadcast with blank, color, or (shudder) commercial messages in the side-bars.

Every advance in consumer electronics, TV, color TV, stereo radio, etc., has been attacked by a combination of vested interests and "Luddites". Why should the consumers in this country be penalized, when Europe and the Far East are already finalizing HDTV plans?

>>--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
>><phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

Please re-read your own signature. If the FCC is allowed/encouraged to snuff real HDTV, what happens to MY (and others) choice? Don't we have an interest in the RF spectrum?

By the way, I'm not a licensed amatuer. I saw the HDTV posting over a friend's shoulder. But, please notice that I have NOT advocated or defended grabbing any of "your" bandwidth for "my" uses.

I've heen told it's safer to climb a Rohn-25 with the point, rather
than the face, of the tower toward your body. This seems to give you
more shoe contact (but you tend to waddle a bit since your feet are angled
to the side) and best of all gives you a chance at grabbing at the tower
should you lose your grip. In other words, don't treat the tower face
as a ladder; straddle the tower while climbing or descending.

I understand that even military electronics has its limits, and it IS being hardened these days. THAT IS THE ADVANTAGE AND THE BASIS OF THE INTERNATIONAL REQUIREMENT FOR A KNOWLEGE OF CW BELOW 30MHZ.

Yup, why just last week a nuclear weapon exploded near my house and the resulting EMP destroyed all of the SSB and RTTY circuits in my IC-751A. But the CW circuits kept on workin' just fine. Boy, was I glad I had learned the code so I could keep on chewin' the fat with the boys on 80...

Those who argue that CW is essential when "the chips are down" seem to consider only the transmitter. How about the receiver, which is much more susceptible to EMP? Remember, if you can't hear 'em, you can't work 'em. If simplicity of overall system design is what you're after, then AM is the mode to use since it can be received by crystal sets.

If you reread Brian's original posting, you will find that he said
for "weak signal" work he would use DSP. He didn't say he would use
DSP on weak "CW" signals. In fact, CW is not particularly well suited
for weak signal work since it doesn't retain phase coherence from
pulse to pulse. Slow PSK is a much better choice for really weak signal
work as witness Voyager.

EMP is the *basis* of CW requirements? You must be pulling our legs, right? I don't believe any country had the capability of detonating a nuclear device a few kilometers over your head when the CW regs were first put in place.

Lets face it, most Hams, CW ops or not, would probably head for the nearest HRO after they get hit by lightning. I see no reason why knowledge of CW would have any bearing on a person's ability to homebrew a rig after a big one hits.

Ahhhh, I know, after the EMP hits, the CW op would find an ignition coil from a '48 Ford that has not been zapped, look for some iron filings to fabricate a coherer with, and communicate using ..... SPARK! :-)

In the foreseeable future the FCC is going to pontificate on the No-Code question. When that happens, what will the sclerotic and gasping old farts have left to whine about?

May I suggest a new cause? How about the Metric system? I am sure some of our usual correspondents can generate reams on why its no good, how it will never work and how you can succeed without it.

May I kick it off by pointing out that it was introduced by Napoleon in 1801 and is now the usual system of measurement in all countries except the U.S., Brunei and maybe another couple of fiefdoms.

The connection here is that most countries have No-Code except the U.S., Bermuda, Jordan and a few other fiefdoms. I find amazing similarities between these two subjects. They also both concern change and future technology.

So get ready to fire up the arguments to support a measurement system inherited from the British and generally known as "Imperial Measure".

You can build any kind of transmitter you want. Operating it into an
antenna is a different matter. :-)

> How would you like it if the Elks lodge owned Yosemite National
> Park and restricted it to members only.

If all I had to do to become a member was show that I know how to
act within the park so as not to mess it up for other park users
and neighbors of the park, it wouldn't bother me a bit. Judging
from some of the behavior I have observed in national parks, I'd
even say it's not a bad idea!

>So, it does indeed have a delay function.

No, it DOESN'T have a delay function, as scanner users are used to.
There should be _TWO_ different delays, after which scanning will resume.

In other scanners, scanning will resume almost immediately after the
carrier drops, unless the delay function is set. If the delay function
is set, then scanning will resume a few seconds after the carrier drops.
In this way, you can program simplex frequencies and repeaters with
very short hang times with the delay, and repeaters with long hang times
without the extra delay. This is a much nicer scheme that the R1 seems
to provide (after my quick scan of the R1 manual).

301. EMP in the movies

Newsgroup: rec.ham-radio
Date: 1990-08-09 04:49:26 UTC
From: winter@Apple.COM
Message-ID: <43787@apple.Apple.COM>
Source record: 9409

Well, I can't let this discussion of electromagnetic pulses go by
without mentioning the nice bit of accuracy in the movie "Testament."
When nuclear bombs destroy the San Francisco area, EMP fries the
transistorized equipment of the local ham (your basic grandfatherly
type) in the small Sierra foothills town where the movie is set.
BUT!....his old tube-based gear survives, and he uses it to maintain
contact with the outside world as long as possible.

Uh-oh, now I've probably started a war about tubes-vs.-transistors
to replace the current CW-vs.-SSB debate. :-)

By the way, it's a damn fine movie. Depressing, but excellently done.
And a prize goes to the first person who can tell me how to get in
touch with my one-time coworker Shawn Murphy, who did the audio for it.
He also mixed the "Batman" soundtrack (for the album release).

Incidentally, I've tried matching up the callsigns mentioned in the
film with the names of people mentioned in the credits (especially
engineering types), but haven't found any correlations. However, I've
never gotten the thing on tape and thus have had to read the credits
quickly as they went by, so I may have missed someone. Anyone know how
those particular callsigns were chosen for use in the film?

303. How do I get rid of mobile radio static ?

Newsgroup: rec.ham-radio
Date: 1990-08-09 05:48:30 UTC
From: slr@tybalt.caltech.edu
Message-ID: <1990Aug9.054830.8148@laguna.ccsf.caltech.edu>
Source record: 9413

I have a cellular phone installed in my car with a roof-top mounted antenna. When the unit is transmitting, and when I turn the steering wheel back & forth, it produces static in the receiver.

The unit is crystal (no pun) clear when I put it in the diagnostic mode and disable the xmitter.

I tracked the problem down to the steering column which has a contact for the horn switch. This metal rod makes contact with a metal "wiper" that allows the steering wheel to turn while still making contact. (Sort of like a volume-control pot with the wiper always providing low-resistance.)

When the metal rod runs across the steering wheel contact, it produces static. The radio is wired directly to the battery.

Suggestions ?

{ I hope I won't be branded a "Yuppie" for having a car-fone ;-) }

>The solution you describe in which encryption is involved is illegal
>in the United States -- no encryption on the amateur service.

I disagree. The rules prohibit the hiding of information - they do not ban the use of cryptography purely for authentication purposes.

For example, you might issue a confirmation consisting of a QSO number, callsign, time and date, in both plaintext and ciphertext. Only the issuer could have generated the ciphertext that corresponds to the known plaintext, but since the plaintext is already sent over the air nothing is hidden. A public key scheme would be much better here, since it would eliminate ANY possibility of hiding information (anyone could verify an authenticator, even though only the originator could have generated it).

Of course, to make any such scheme cryptographically secure it would have to consist of at least 64 bits of both plaintext and ciphertext. And given the speed and accuracy of most CW QSOs I doubt that many of the contest ops would go for such a scheme...

>Now we have two grounds internal to our circuit board.
>What do we do with them?

Tie them together at the power supply, or as close to the power supply as possible. That way, switching currents in the logic ground do not lead to voltage variations in the analogue ground because of the resistance in the logic ground wires.

EMP as a justification for CW testing? Dont make me giggle!
Remember; a decent EMP will take out *all* your semiconductor devices; it will also make quite a mess of even some electromechanical systems (do any telcos still have STROWGER exchanges? *they* just *might* survive!).
If you do get EMP'ed then you will most likely lose your AC supply.
How many hams could put a station on the air using no semiconductor devices, and powered from auto batteries? Does anyone remember vibrator or dynamotor power packs for generating the B+ rail in the good old tube days?
Has anyone still *got* any of this gear? Does it work? Mine does.
And surely AM is the best in an emergency because you can receive it on a rusty bolt.
CW testing is as irrelevant to EMP preparedness as it is to ham radio.
Why not bring back the requirement that all autos must be preceeded by a man with a little red flag. Anyone remember Semaphore?
Come on America! Follow the LEAD of much of the rest of the World and introduce a code-free licence. Sign a reciprocal arrangement with CEPT so you guys can come over here & work the bands without the hassle of applying for reciprocal licenses.

You could use a saeft (BKSP is dead) safety decender used in mountain climbing (or more often, rescue) which is a gaget that has 5/8ths line run through it, and when release (it has a lever on the side), it locks.

I think they can also be had with a rachet in one dierection and again, locks up when released.

...and then, you could also climb half way and use a bunji cord...

|> anyone know of a commercial device that can prevent a person from
|> falling off a tower during climbing?

The most common fix is to use "gorilla hooks." These are hooks that have a snap-closed link over the hook opening (like a carabinier clip) that attatch to your climbing belt (One on each side) with a three or four foot section of line. On the way up, you clip one to the tower, climb a few rungs, reach up as high as you can and clip the next one. Reach back and unclip the first. Climb a few rungs... (etc.) If you slip, one of the hooks will be in place to hold you. The clips pretty much get hooked on where you would normally be holding with your hands anyway. It's low-cost and low-tech. The people who sell climbing belts in the back of QST usually sell gorilla hooks if you don't want to make your own. (At least your estate will have someone to sue.)

There are also commercial devices that attach to a cable running down the tower and lock to the cable if you start moving fast (assumes fast = falling.) These are often available from tree service suppliers or construction suppliers that specialize in steel.

Actually as a percentage of the operating frequency, this is even closer
spacing than at VHF. The Q of a filter effects it's PERCENTAGE bandwidth.
Normal practice is to space the channels as far apart as possible, filling
in the holes only when new stations are built.

>
>]Designing a fliter system that is very flat with 0.2 degree phase linearity

>]is neither simple nor cheap. Phase linearity is the key here as our
>But it really isn't that hard to do for rejection with ONE guard channel
>on each side, which would greatly reduce the waste of UHF spectrum.

In fact the FCC has recently completed a "dropin" channel study to see
if more channels can be used in the VHF band. There are many factors
to be considered such as co-channel interference, adjacent channel
interference, second adjacent channel interference, intermod, and
image interference. Already mileage seperation rules are routinely
waived if the local terrain will insure adequate blockage. Another
nasty little problem is TV channel 6 and noncommercial FM broadcasting.
Since they share immediately adjacent frequencies, this has been the
source of many problems. Also TV channel 14 has been taken out of
service in some areas to protect land mobile users. Similarly Ch 69
has been eliminated in many communities to protect cellular phone.

>
>I should also point out that an experimental license was issued to

They also use much less power which helps as well. But it's not another
television service. Remember too that there are $50 billion dollars worth
of receivers out there now and nobody seriously thinks they can obsolete
that much equipment overnight.

>HDTV use microwave spectrum ONLY.

You may not have heard of multipath problems, but I sure have. Moving the antenna as little as an inch up down or sideways can change the picture from great to unusable. Most homeowners don't install antennas with that much care. Most pay TV using the MDS system uses trained installers for the receivers. Most of the receivers are installed at hotels and bars. Many locations simply can't be served. Microwave service is extremely terrain sensitive. What might work in the wide open spaces of the west simply fails in the rolling terrain of the east and in densely populated areas. Case in point, we use microwave links between our studios and transmitter in Atlanta. Due to the high rise mania in midtown, new buildings are springing up all the time in or near our path. We have had to construct new towers twice in the last three years to keep our signal going to our transmitter. In one case the building was directly in the way, in the other case the building was in the first fresnel zone and multipath became intolerable. That's two new 300 foot towers less than 100 yards apart in two years. No consumer is going to put up with that.

And what do the "cellular as an emergency service" nay-sayers think of this use of Motorola's cellular system? I'm probably starting to sound like a broken record but we need to find new sources of political capital to keep our allocations! Public service, though a good customer in the past, isn't enough. The suggestion that education is a reasonable "market" seems like a good one, though it would seem that we should look to develop other sources too, eg use in research, public data service, etc.

>

That may be a good reason for the CW requirement now days. Without tubes which may become extinct in the next decade or so what good is that even. The origional reason for CW in HF requirements was to be able to communicate with distressed marine vehicles which ALL carried a minimum 500KHz emergency transmitter often capable of being powered by hand generators. Later the aeronautical interests adopted these radios for emengency purposes.

I wonder what the current requirements are along these lines. 500KHz is still an international distrress frequency isn't it?

So you're saying that the ITU in their great wisdom forsaw EMP from nuclear weapons in 1927 when they mandated CW? Get real! If EMP gets your general-public electronics (your radios) you're going to send and receive CW? With what? Are you going to dust off your tube radio, throw away it's microphone, and send CW? Or maybe you are going to BUILD a radio from the parts of discarded TVs. Too bad! all the TVs are solid state too and are trash.

In reality, protection from EMP is fairly well understood by the technical community. Other than equipment connected to large outside antennas, most equipment will survive any EMP that YOU will survive. In the ham radio world that means VHF/UHF HTs. Let's see, where do I plug the CW key into this FT470?

>works in strange ways!

Since I was both licensed and a subscriber to 73 during that time period, I can say that Wayne was NOT in favor of incentive licensing then nor now. In fact he attempted to setup an opposing body to the ARRL called the IARL to lobby against the ARRL's incentive licensing scheme. He predicted then that incentive licensing would stifle amateur radio. I have every issue of 73 on file (charter subscriber) so if you have a quote that supports your claim, post the issue number.

Subj: Re: Qualification-based licensing

The way I (mis)understand EMP, there's nothing you can do to prevent
damage from it. Yes you can protect yourself from lightning's direct
effects, but the indirect effect (EMP), not without hardening. Anyway,
I should have gone a bit further in my statements, to indicate:

I am FOR a no-code license, but code DOES still have its place in the
real world, vis-a-vis EMP if for no other reason. Consider:

Balloons are still allowed in the HOBBY of flying.
Model Ts are still allowed on our streets.
Large-wheelers are still allowed to be ridden by bicyclists.
(Looking at the first example, I realize I may be im-
plying too much that balloonists are "merely" hobyists.
Such is not my intent.)
Sailboats still ply our waterways, as do paddlewheelers.
Amateur Radio is a hobby, and as such it has MANY facets. To
state that any one facet is UNNECESSARY is tantamount
to bigotry, IMHO, and I can point to several teenagers
in my "home" club who would agree. This is not a flame
directed at ANYONE; I sometimes get a bit strong in my
statement of feelings...one of my personality quirks (I
think we all have one or two of those..).

Anyway, to end on a higher note (A above middle C): thanks for your
comments, Rick. I do realize we are all technically-oriented, I had
simply never seen EMP taken into consideration when all our modern
techno-rigs were being discussed. There are still several factions out
in the world, any of which MIGHT someday use a nuclear weapon against
the "civilized" world, and a lot of hams (myself included, as I have no
major desire to work CW) are not going to be able to assist with traf-
fic handling, due to their rigs' inability to cope.

73, and good Hamming!

Does anyone know how to increase the UHF Rx on a Yaesu Ft-470. I have found a way to increase the VHF Rx to 130-170 MHz and would like to do the same for UHF.

BTW: Being a new addition to Info-Hams (and a fairly new addition to the Communicator licence with great interest. Is it possible that in the midst of the discussion that sight of the end goal may be lost?

It appears to me that the vast majority of my fellow hams are gentlemen with much experience in life, shall we say. It also appears to me that the influx of new hams is minimal. Is it possible that new class of licence might be the only manner in which to save the spirit of our hobby from its demise?

Now, check your flame throwers at the door, gents. This is just food for thought.

> Think about where the AUTHORITY of a coordinator to deny a coordination
> SHOULD come from?

The coordinator's authority ideally comes from the consent of the
governed (sound familiar?). If the operators (not necessarily OWNERS)
of coordinated repeater systems consent to the recommendations of
the coordinator, there is no problem.

As soon as the bulk of the operators stop cooperating with the
coordinator, they stop cooperating with one another by definition.
They have only themselves to blame for their own mess. Too bad.

In article <09.Aug.90.10:00:41.BST.#1077@UK.AC.NWL.IA> PJML@ibma.nerc-wallingford.ac.uk ("Pete Lucas, NCS-TLC, Holbrook House, Swindon") writes:
]EMP as a justification for CW testing? Dont make me giggle!
]Remember; a decent EMP will take out *all* your semiconductor devices; it will
]also make quite a mess of even some electromechanical systems (do any telcos
]still have STROWGER exchanges? *they* just *might* survive!).

I think it may be time to inject a bit of reality into this EMP discussion. I have heard the following myths:

(1) EMP isn't a threat, because the same bomb will destroy you anyway.

-This is simply NOT true. A deliberate EMP attack involves detonating high yield weapons at very high altitudes. Only the light and the EMP makes it to the earth's surface.

(2) EMP will wipe out all your semiconductors.

-Hey, folks, EMP is not some magic demon that seeks out and destorys micron-sized transistors! It is radio frequency electromagnetic radiation, of extremely high power, lasting a very short time. As such, it requires antennae before it can do damage. If your equipment is reasonably lightning protected, it is also reasonably EMP protected. Furthermore, the energy goes down with frequency, so most 2 meter and 440 equipment will survive (unless it gets zapped from the commercial power mains). Most of our repeater sites here in Arizona are hardened to FEMA standards for EMP, and have emergency power that would also withstand EMP. We did this primarily for lightning protection! Your HT's would almost certainly survive (unless they were plugged into rechargers at the moment of truth). Lots of HF gear, but certainly not all, would survive. Mine would probably survive because it spends most of its time disconnected (to protect it from lightning).

Re: EMP as a reason for CW. Well... that's stretching it a bit folks. CW IS useful in emergencies, but for more mundane reasons:
(1) It gets through where SSB doesn't.
(2) Lower radiated power can be used. Since power supplies AND antennae are problematical in emergencies, this counts.
(3) It is, in fact, much easier to rig an emergency transmitter. As has been pointed out, it is not easier to rig an emergency receiver.
(4) It is more likely to be available, especially in third world countries, than DSP based systems (at least for the next 10 years). Lots of our emergency communications are with third world countries.

(5) It seems to be better than voice for communicating between speakers of different languages.

Finally, let me point out that I don't have a strong opinion on whether the above should force CW to be required for an HF license. I do STRONGLY support a CODELESS license for ALL VHF/UHF frequencies with full priviledges on those frequencies.

This extra class licensee says:

---DOWN WITH INCENTIVE LICENSING!---

[gee, I've been waiting 25 years to say that! ;-)]

327. Re: Iridium Cellular Service

Newsgroup: rec.ham-radio
Date: 1990-08-09 18:23:10 UTC
From: glenne@hpnmdla.HP.COM
Message-ID: <1250212@hpnmdla.HP.COM>
Source record: 9349

Well, maybe I'm not imaginative enough, but I'm pretty hard pressed to see how Iridium is going to hack it. Where have I miscalculated or made a grossly incorrect assumption?

The details refer to small satellites each serving 37 cells which are 360 miles across. If the satellite is small, where does it get a lot of power? Suppose it is covered with PV cells, maybe getting a couple of hundred watts for the whole thing. Can it really get much more than 10 watts or so to 1500 MHz RF?

10 watts among 37 cells is about a quarter watt/cell if the satellite can manage the antennas to optimumly direct the beams. This is not a particularly miniscule antenna at this frequency. A 360 mile/side square is about 3.35E11 square meters. Each square meter then catches 115 dB less power. That's about +24 dBm - 115 = -91 dBm. But at 1500 MHz a 1 meter square aperture antenna implies a gain of 24 dB or so and a beamwidth of about 10-15 degrees. If an omni antenna is used we lose all but a couple of dB of this gain.

Since these things are flying across the sky, for the gain antenna to work the ground end is going to have to do a lot of pointing. So we would have to come up with an (inexpensive) electronically steered array along with algorithms to find, track and execute handoff on the ground end. This steering must work on both receive and transmit. All this to get -91 dBM/(KTB) = 46 dB in a 5 KHz bandwidth (my number).

Considering the user data rates I'll assume the omni antenna case. The omni antenna is going to give only 24 dB of C/N. Actually it will be worse than this since it is looking at surrounding terrain at 290 K or hotter and antenna losses/receiver noise figure won't be perfect. Now we have maybe only 21 dB with the omni antenna and we haven't dealt with what happens when the user is in the 3rd ring of the clusters and the satellite is 3*360=1000 miles away. I did it quick but it looks like the satellite is only about 15 degrees above the horizon. If every user has an LOS shot above 15 degrees elevation, no wet trees or other problems to chew up more than a very few dB, I guess he gets his 4800 bps information rate, assuming no overhead in dispensing the bandwidth among all the users, collisions etc.

So, after the user has bought a *bunch* of hardware, made sure he can see down to a low enough elevation AND paid his share of the N billion dollar investment and maintenance for the system then he gets 4800 bps to use.

It seems like I saw an estimate of $2billion for the initial system. If after buying his ground station a user will pay $1000/year and it has

to be replaced every five... it seems to take 400,000 users/supporters.
Thats about 5000 users/satellite, 140 users/cell to break even.

I'm not convinced that the market will support that kind of service
at that high a price.
Certainly in developed countries 4800 bps is going to sound pretty
meager by the time the whole thing is functioning.

> public data service, etc.
>
> Rick Spanbauer
> WB2CFV

First...the system isn't in place, doesn't have approvals for spectrum usage, etc yet. Until it IS in place, it doesn't help solve the communications problems out in the boonies. It obviously will if it does become a reality.

Secondly...depending on any ONE system in emergency work isn't a great idea. Ham radio isn't the ONLY way to solve emergency problems, its just one of the answers....and will probably remain so. All of these systems are viewed as complementary by the emergency services using them...not in competition.

As for looking to other ways to justify our spectrum allocation, the emergency aspect SHOULDN'T be used as the only arguement...but it IS the easiest one for the general public to relate too, and will probably remain so as well.

The educational aspect that you mention is a good idea, and is being practically pursued last time I looked...the SAREX program is a good example. There is always room for new ideas, and new efforts in this

direction though....got any good ideas on how to employ ham radio
along these lines?

Hi!
I am thinking of buying a 2m mobile and I have a few questions about installing it in my car. I wanted to use one of those on-glass antennas, since I am really not keen on drilling holes in my new car! My car has a post-factory installed tinted windows that is actually tinted plastic coating. Will this tinted layer adversely affect the performance of the antenna? Or perhaps will the antenna affect the tint?
The rig I am thinking of buying is the Alinco DR-110. I already have an Alinco DJ-160 HT and that has been good value for the money. If anyone has any recommendations, I would be interested in hearing them.

On a slightly different note, how much traffic does this digest get? I am on the BITNET side of things and when the digest was carried by the SIMTEL machine, the digest came at about a rate of one a day, now that rate seems to be about one every full moon.

If it's a video relay, it is (probably) FM. (It's in the fine print somewhere, but I couldn't find it). The 902-928 Mhz band also allows low power convential transmitters under part 15. Only the spread spectrum systems get 1 watt.

You'll be dead and I'll be dead and most of everyone we ever loved,
hated, or cared about will be dead too. The universe won't notice and
won't care.

If you are fool enough to think that God, as your personal handmaiden,
is going to help you survive the attack, provide you with power,
re-erect your antennas, and make you a valuable addition to
reconstructing the tatters of society that remain after a nuclear
attack, then by all means, learn CW. Perhaps you'd also like to father
all the children we'll need to repopulate the world, too.

The idea is to make nuclear war unthinkable, Strangelove. Not to
try to survive it. The more people who think nuclear war is survivable,
the more likely we are to have one. Wake up.

Thanks for the ad-hominem remark. In fact, I am very familiar with
multipath, also fresnel regions, selective fading, intermod,
path calculations, and all the other microwave technology that is applicable.
Furthermore, I live in a mountain canyon with a knife-edge shot to the local
TV stations, so I experience a number of path problems myself.. I have also
installed microwave MDS TV receivers.

]the antenna as little as an inch up down or sideways can change the

In some locations. However, if you use spread spectrum to send it,
you become multipath resistant, don't you? With HDTV, we ARE
talking about modern, new technology, aren't we?

]installers for the receivers. Most of the receivers are installed at
]hotels and bars. Many locations simply can't be served. Microwave
^^^^^^^^^^^^^^^
This is not true.

You whole point seems to be aimed at how to get MORE tv to the
consumers using existing technology. I think that, no matter
how commercially attractive, it's about as forward looking
as any other waste of natural resources. Today there
are many ways to get information and entertainment into the
home. VHF/UHF Broadcast TV is one of the most wasteful and is a dinosaur.
It can be replaced with:
Cable (including fiber systems)
MDS
Satellite DBS
C-Band Satellite DBS (ie TVRO)

Right now I get 5 VHF TV channels, and a few UHF. I get 120 channels
by TVRO. A few of those local TV channels are enough to provide local
news and advertising. Why do we need a bunch of others showing old
movies and syndicated re-runs, when they are tying up such an extremely
valuable natural resource (18-42 MHz PER UHF CHANNEL!)?

I've travelled about the country quite a bit, talking to other Hams via open repeaters. I've never been asked to leave a repeater because I didn't belong to its club; nor have I been asked if I belonged to it or any other repeater group. In the rare occasions when I've wanted to do something other than the usual BS (such as a phone patch, for instance), I have always asked for and received help. Someone was always willing to dial up the number for me. I just can't imagine an area where there's the kind of squabbling over who can use an open repeater that I infer from some of the postings.

Source record: 9369

A common cause of TVI is the TV antenna feedline acting as an antenna. Large common-mode RF currents flow on the outside of the coax shield down to the TV where they enter the tuner, completely bypassing the high-pass filter you installed.

Is the TV feedline coax-type? If so, you might use a TWINLEAD-type high-pass filter with baluns on each end. This breaks up the shield connection. Or use a coaxial filter with a pair of baluns connected back-to-back at its input or output.

338. Voodoo TV

Newsgroup: rec.ham-radio
Date: 1990-08-10 00:12:11 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9008100012.AA04190@cmr.ncsl.nist.gov>
Source record: 9348

Voodoo Radio died out on the net some time ago, now we are getting a dose of Voodoo TV. Please look at any FCC TV allocation chart, or even think a little.

1) At VHF, TV channels in the same city may have as little as 4 MHz guard band between them: ie. channels 4 and 5; 66-72, 76-82 MHz. New York City has stations on chans 2, 4, 5, 7, 9, 11, 13, and UHF, for example.

2) At UHF, the percentage difference in carrier frequencies isn't a big problem for adjacent channels, since all TV sets are (surprise) super-heterodynes! Front-end selectivity does affect image response, and helps a lot on some of the unwanted mixing products, of course.

3) TV sets can easily handle signals on adjacent channels, if their strengths are about the same. This how Cable TV channels are set up. 16,17,18,19,etc.

4) If all a town's transmitters were on the same antenna, you just might be able to use adjacent channels, see 3 above.

5) There are so many empty UHF channels since the FCC is protecting poor sets from all sorts of their own flaws: (from a few-year-old chart)
IF beat 20 mi. spacing 8th channel higher & lower
Intermod 20 2nd thru 5th channel higher & lower
Adjacent chan. 55 1st channel each side *
Oscillator radiation 60 7th channel higher & lower
Sound Image 60 14th channel higher & lower
Picture image 75 15th channel higher & lower
* The FCC doesn't make an exception for co-located stations.
Examples are: (all are full-power)
Channel City Channel City
20 Washington 54 Baltimore
22 Annapolis 56 Fairfax, VA on DC Beltway
24 Baltimore ---------------
25 Hagerstown 66 Manassas, VA nr Washington
26 Washington 67 Baltimore
68 Hagerstown

>

> Okay, then why is it standard practice in the telephone business to
> supply battery power for telephone switching machines and transmission
> equipment when it's needed only a tiny fraction of the time?
>
I think there are several reasons for their forethought.

First, Ma Bell and her offspring have been around forever. They invented the telephone system and have kept it at the forefront of technology ever since. Until recently, they were a monopoly that existed by the grace of the government, and they wanted to preserve that status. Even now, they remain a monopoly at the level of the CO. Part of being a good telephone monopoly was and is to provide top service to the customers, and that includes the ability to function under adverse conditions that were foreseeable.

Second, it makes very good business sense for the modern wireline telco to preserve this tradition of dependable service. One of the programs that makes lots of money for the baby bells is 9-1-1 in its various forms. Now, it would look really poor to the towns and counties thinking of buying into 911 if the underlying phone system were prone to failure on even a rare basis. When fire or a police dispatchers lose their phone, they get upset really fast. They are not at all willing to tolerate a phone system which is down whenever the mains power goes away for more than a short (UPS time range) time.

There are many other customers of the wireline telco that DEPEND on VERY dependable service over the phone. Not the least of these are the everyday homeowners that want very much to have a phone when the power goes out. All together, there are good business reasons for the CO to have a very dependable power source.

I don't believe that the average cell phone carrier is so motivated. There are few businesses or public safety agencies that I know of that DEPEND on the cellphone system the way that they do the wireline system. Neither are the cellular carriers monopolies in any of their service areas (even if there is only one carrier, it is only because of a market too small or unprofitable for a second to share it.) The world does not stop when the cell phone switch goes down, the way it does for the wireline phones.

Also, most of the cellular companies came into being at a VERY competitive time in their markets; the Bells were a formidable competitor. The budgets under which these systems were conceived and

built were much tighter than the conditions prevailing as Ma Bell expanded the wire phones across the land. The result is that smart business in the time and service of the cellphone is much different than that of the wireline phone.

> I would argue that most amateur radio facilities are nowhere near as
> well maintained and backed up as the average telco facility.

Absolutely no argument here. However, the ham "system" has as many levels of redundancy as there are hams with radios. Can you touch that? I doubt any system can. (let's not discuss CBs...)

How many folks on here have SEEN real HDTV? Well I did last week, and
I was VERY IMPRESSED! I was in Seattle Opera's production of War & Peace,
which was being taped using HDTV. It was awesome. Between my scenes
last week during the two days of taping I went out by the production
trucks where they had a monitor set up. The only way I can describe it
was like squeezing 70 mm film into a box. The aspect ratio was different,
with a wider screen, and the detail was amazing. When the camera did
a long shot of the entire stage, I could make out the faces of every
individual member of the 80-odd chorus. The production folks are talking
about possibly doing a film transfer for theatre distribution....it's
that good.

For some reason though, the opera folks kept describing the process as
"filming"!

At the university level one of the best ways to integrate amateur radio is in an electrical engineering program. There probably aren't many better places to put one's communications theory, dsp, microwave, circuit design, etc courses to work. If the code requirement was relaxed it would be possible to funnel students through a "ham radio lab" to get licenses in their sophmore year. If we choose to continue chasing public service one could always get the student volunteer ambulance corps types interested in FEMA, etc.

I don't know what goes on in high school these days, so I have no suggestions on how to capture those kids. Just to take a wild swing, perhaps if we get the content rules under control such that every other response to a message isn't "We shouldn't talk about that, FCC rules..." perhaps the BBS aspects of packet would interest HS kids, ie Radio Compuserve.

It would seem possible to catch kids in elementary/junior high with satellite applications, or remote control/telemetry as applied to robotics. Or possibly exchanging pictures via satellite packet with their peers in other countries.

Generally speaking, people seem to be interested in video these days; it might be possible to snag people at all levels if they could be their own low power TV station to tie in with the desktop video/vcr/ home entertainment angle. Or maybe a year 2000 pacsat with video compression & storage such that it could forward video messages, ala picturephone mailbox.

If we ever get the packet data rates up to the point where decent applications can be built, then we can start to look at things like making "telescope servers" (move telecope to point, digitize picture, send packet picture back), weather sat servers, network of weather stations for realtime data collection, remote HF rcvrs for propagation studies, paperless multimedia AR magazines (see the fellows station, listen to audio clip of him contacting DX, etc).

> 1) What is MCW ??
> 2) Is MCW = AFSK RTTY = F2B ??
> 3) What is FM Telegraphy using on/off keying of an audio tone fed into the
> input of the microphone ?.

MCW can be a number of different emission designators. The FCC attempted to categorize the designators rather than have to code them all individually into the rules (there are a LOT of possible combinations we want to be flexible to try).

97.3(c)(4) MCW. Tone-modulated international Morse code telegraphy emissions having designators with A, C, D, F, G, H or R as the first symbol; 2 as the second symbol; A or B as the third symbol.

For those of you who use regexps: [ACDFGHR]2[AB]

97.3(c)(5) Phone. Speech and other sound emissions having designators with A, C, D, F, G, H, J or R as the first symbol; 1, 2 or 3 as the second symbol; E as the third symbol. Also speech emissions having B as the first symbol; 7, 8 or 9 as the second symbol; E as the third symbol. MCW for the purpose of performing station identification procedure, or for telegraphy practice interspersed with speech. Incidental tones for the purpose of selective calling or alerting or to control the level of a demodulated signal may also be considered phone.

Regexp: ([ACDFGHJR][123]|B[789])E

Notice that what might be considered MCW would be considered "Phone" for the purpose of being legal. Thus where MCW is NOT legal but Phone is, you can go ahead and use MCW for the purposes mentioned in 97.3(c)(5).

> usually mean good worldwide radio comunications....
>
> ????? If absorption is proportional to the amount of ionization how could
> you get good long distance communications during a high sunspot number

> when ionization is at maximum ?????

The absorption is responsible for making the lower frequencies less usable during higher ionization. But at higher frequencies, the higher ionization actually brings about enough bending to make long distance communication possible.

There are TWO things going on at the same time. Absorption causes lower frequencies to be less usable. The bending angle is also greater and the skip distance is therefore lower as well. The greater bending angle is also making the higher frequencies now usable.

The cutoff at the higher end is rather abrupt (MUF), and is quite gradual at the lower end (LUF). Unfortunately this is only a simple explanation for a complex subject.

Yup and us guys down here in the third world where the local telco still uses Strowger gear and the phones are all rotary, we don't worry about EMP either. Every day, most of our calls fail and the audio quality sucks. Long distance is a nightmare. But hey when they drop the big one, we can call each other up and say: "Cecil, did you see that flash? Sure scared the womenfolk round here, them that's still alive.

But of course, all the cars with microprocessors will be useless too. Good thing I know how to ride a horse. If I had my way, I would make horsemanship a requirement for a drivers licence. When nothing else will get through a horse will. We need horse riding skills for disaster relief.

And now we return you to the late 20th century.

345. Re: English R1 Manual available via anonymous ftp

Newsgroup: rec.ham-radio
Date: 1990-08-10 09:19:13 UTC
From: kpt@doc.ic.ac.uk
Message-ID: <KPT.90Aug10101913@dirty.doc.ic.ac.uk>
Source record: 9346
Cross-posted to: rec.ham-radio,rec.radio.shortwave

In article <26483@usc.edu> kjh@pollux.usc.edu (Kenneth J. Hendrickson) writes:

After reading this R1 manual, I failed to spot any "delay" function,
whereby an extra delay can be added to a simplex frequency, or a
frequency with a repeater with a short hang time, so scanning won't
resume until a response is heard. Does the R1 or the R100 have a delay
function?

You can set the R1 to pause for 10 seconds and then continue regardless
of any signal being present or to lock on to a frequency in use and
only continue if the signal goes away for two seconds. Yes it would
be nice to be able to increase this time.

I also note the lack of "banks" for scanning, although you can set the
lower and upper memory channel to scan between, effectively having 1
bank.

Yes the R1 does have 10 scanning banks with two frequencies, tuning
step and receive mode settings for each bank (see pages 16 & 17
programmed scan). When scanning in this way you can just press a
digit at any time to switch to that bank. You can also press MW
(Memory Write) if you get a signal that you don't want; the R1 will
then store that in a memory and ignore that frequency in future.

The R1 has in addition an upper and lower bound for scanning memory
channels. When scanning a range of memory channels you can set
individual channels to be skipped and you can do a mode scan whereby
only memory channels set to eg. AM are scanned. In addition to this,
you can set the R1 into priority watch while scanning memories and it
will check the next memory channel in turn every five seconds.

If Icom is planning for a future model with these features, or more
memories, then I think they should be faulted for this also. They
should just do it right the first time, corner the market, and take
their profits right away. I'm a poor student, and although I would like
such a receiver, even as it is, I can (and will) wait until something
more to my liking comes out. :-)

I would like to be able to set a frequency on the VFO and then say ok
scan up (or down) from here; I can only do that at present if the VFO
frequency is in one of the scanning bank ranges and then it switches
to the bank's mode and tuning step.

Kevin

Here is a reprint of a review of the Icom IC-228H posted August 1988.
Since that time, I have enjoyed using the 228H daily without trouble,
and the older IC-28A still works flawlessly. Icom just introduced
the IC-229, a smaller version of the IC-228, so you can probably
get a 228 at a reduced price.

PRODUCT REVIEW: ICOM IC-228H 2M TRANSCEIVER

by Bob Parnass, AJ9S

My Icom IC28A performed very well, and giving it to my wife
afforded me the opportunity to buy another 2 meter radio.

What do I look for in a 2 meter transceiver? Being a
scanner enthusiast, I look for wide frequency coverage on
receive, and reasonable scanning facilities. Reliability
and ease of obtaining schematics and parts are important,
and Icom, Kenwood, and Yaesu score well here.

I prefer 25 watt radios to 45 watt radios for a few reasons:

1. I believe manufacturers overrate their transmitters'
power specifications. Most models use hybrid modules
for the driver/final amplifier stage. As a recent QEX
article points out, the hybrid modules are only 25% -
50% efficient, which means the bulk of the power is
dissipated in the form of heat.1

The heat sinks on today's radios are just not big
enough to dissipate the kind of heat developed during
my typical QSO (conversation). The heat sink on my
old 25 watt Motorola MetrumTM never got nearly as hot
at the heat sinks on late model 25 watt Japanese
radios. My 25 watt Kenwood TR-7800 and IC28A became
very hot during QSOs. Pity those who bought Kenwood's
"45 watt" TM-221A transceiver. It's not until they
read the owner's manual that they learned Kenwood
recommends against transmitting for more than 1 minute
out of 3.

Heat shortens the already finite life of the hybrid modules, and I've been forced to replace these modules on various radios, to the tune of over $55 apiece (not including my labor).

2. It's easier to find power supplies for 25 watt radios, because they require only 6 - 7 amperes, versus 9 - 10 amperes for their 45 watt counterparts. The smaller power supplies are less expensive and are easier to find surplus.

3. Signals from 25 watt transmitters are almost as strong as those from 45 watt radios.

The IC228A/H series is Icom's replacement for the IC28A/H two meter radios. The tradition of offering two models at different transmitter power levels continues, with the 25 watt IC228A and 45 watt IC228H.

The IC228 contains a single VFO, and 20 memory channels. All the memory channels behave the same, as contrasted with some Kenwood designs which limit the flexibility of certain memory channels, while permitting special operations with others. Each IC228 memory channel can store receive frequency, CTCSS tone, transmit frequency offset, and scan list lockout.

Unlike Yaesu radios, the IC228 comes equipped with a synthesized CTCSS (PLTM) tone encoder, which is almost a necessity for using repeaters in the Chicagoland area. Any one of 32 tone frequencies can be selected from the front panel, and associated with a memory channel or VFO.

Repeater offsets are selectable from 5 KHz through 10 MHz, and can be stored in memory. You could conceivably store 20 different repeater frequencies in the IC228, each with a different offset and tone.

I wanted the 25 watt IC228A, but only IC228H models were available at the time. I'm glad I bought the IC228H high power model, because an internal potentiometer made it easy to reduce power output from 45 watts down to 25 watts. The large heat sink affords extra cooling capacity, and the final amplifier should last longer. Even so, the heat sink becomes too hot to hold during a moderately long QSO! Heat is eventually transferred from the heat sink to the entire radio case, making the entire radio "untouchable."

The major changes in IC228 circuitry from the IC28 design involve the microprocessor. The RF circuits remain similar, using the same transistor lineup in the transmitter stages and the now familiar Motorola MC3357 IF detector/squelch chip popular in scanners.

Icom took cues from the Kenwood TM2530 series to improve the LCD display panel and make the front panel controls visible in the dark. The display on the IC228 makes use of colored backgrounds for various fields, and is easier to read than the display in the IC28.

Unlike the IC28, the IC228 emits a beep tone each time a key is depressed. Although some people find this feature annoying in walkie-talkies, the beeps make it more convenient to operate the IC228 while driving. Icom recognizes freedom of choice, and permits the user to disable the beep.

The volume, squelch, and tuning knobs, as well as several buttons, are now backlit - an improvement over the IC28. The IC28 contained a photocell which automatically varied the LCD backlighting with changing ambient light levels, however the newer IC228 permits the user to select from 4 fixed levels of backlighting.

There is no free lunch, and Icom fans had to give up something in exchange for the new control backlighting: the plastic front panel and tuning knob on IC228 feel chintzier than the metal panel and rubber padded knob on the IC28.

Another new feature is a "lock" pushbutton, which disables the radio's front panel controls. I haven't found this as useful as the lock slide switch on the DTMF up/down microphone. The up/down pushbuttons on the microphone can be bumped accidentally in the mobile environment, and the slide switch prevents unplanned frequency changes.

The IC228's scanning features are on par with, or slightly above those of other 2 meter transceivers, but not as well implemented as in "real" scanners. The IC228 scans at the same speed as the 28 - rather slowly. A reasonable memory scan, with channel lockout, is provided. This is an improvement over the early Kenwood TH-215 walkie-talkie memory scan, which lacked a lockout feature, so one was forced to scan ALL channels.2

The timer operated scanning in the IC228 causes the radio to resume scanning 2 seconds after the carrier drops, or after 15 seconds - whichever occurs first. Too bad the IC228 lacks a carrier operated mode, like the feature in the Kenwood TM2530, so the receiver would "stay put" until the carrier drops.

The IC228 includes the ability to search between 2 frequency limits, and users of the American versions can select tuning steps of 5 KHz or more. The search limits are programmed into a special register pair, so they don't tie up memory channels. The search will pause as soon as the squelch opens, which usually brings the receiver to a halt off the

center of the station you want to hear. Unfortunately, Icom didn't adopt the Kenwood "center tuning" or Bearcat ZeromaticTM feature, which forces the searching to stop right on the center frequency. The Bearcat window detector circuit employs operational amplifiers, fed by the discriminator signal, to generate a logic level when the receiver is tuned within 2.5 KHz of center frequency.

When the IC28 was first introduced, it was offered with either the standard or DTMF microphones, at two different prices. Apparently, most people wanted DTMF mikes, and a DTMF microphone is provided with the IC228.

Except for the high heat sink temperatures, the IC228 performed well during a recent cross country trip. With the radio bolted to the center console of my truck, the receiver audio output was ample, the display easy to read day and night, and stations in Pennsylvania and Ohio praised the transmitted audio quality.

I'm pleased with the IC228, and recommend it.

---

1. See "RF Hybrid Modules: Building with Bricks," by Bill Olson W3HQR, in July 1988 QEX.

2. Late vintage Kenwood TH-215 walkie-talkies now come with upgraded firmware which permits channel lockout. A new CPU chip may be retrofitted into earlier units, but Kenwood charges for this service.

I just talked to someone at Antenna Specialists. He said that if you have an aftermarket tint you should cut the section out. Otherwise, he claims 3dB gain over 1/4 wave.

If anyone knows anything bad about this antenna, please let me know, too. I am about to buy one soon.

When were you last in England? This past May I was surprised to
find temperatures usually quoted in F, speeds in mph, and all the bad-old-
units still in wide use. Australia and New Zealand were thoroughly SI (not
metric) back in 1973; much more than England today.

Scott: I tried to send you e-mail, but your address didn't take.
The mod works great! The Alinco is one GREAT radio. I did notice that
when I had a 450 mhz AND a 850 mhz frequency in the two displays, that
the radio would only hear one of the signals at a time. If 850 was
the primary frequency, then the 450 would squelch when a 850 signal
came on. Can you tell from the service manual why this might be?
Is there one front end PLL circuit for both of these bands, and only
one can be heard at a time? My only criticism of the Alinco is that
for all the frequencies it can hear, it would be nice to have more
memories. I noticed that the 850 channels get memorized in the
2-meter bank of channels, which I guess is a function of the switching
of the 2-meter band for the 850 band.

I'm so impressed with the Alinco, that I'm considering a DR-510 for
my other car. I know that its style is similar to the DR-110T, but
does the 510 have a similar mod to open up its coverage. The DR-110T
has a little yellow wire on the top left aspect of the radio which, when
cut opens up the receiver for out-of-band coverage. Is the 510
likewise modifiable, and will it open up the UHF receiver spectrum?

Thanks again for your help with the 570!

>Now we have two grounds internal to our circuit board.
>What do we do with them?

Having two grounds may or MAY NOT result in a significant reduction in logic noise coupling into the analog circuits; a well-designed single-ground-pland board can be made pretty noise-free as well as a dual-ground scheme. However, if you're set on separate grounds, they obviously must tie together somewhere - assuming, for example, that the logic section provides control signals for the analog section, they won't be able to talk to each other unless they either both think "ground" is the same or you use differential drivers/receivers for the control lines. (One other option might be to couple the two sections *optically*, but that's probably only viable if the number of signals is fairly low. But it'd be a very nice way of getting lots of isolation from noise.)

The grounds may be connected either on the board, perhaps via some ferrite-beaded jumpers at several locations, or back at the power supply or motherboard (if you have one). One problem which I've seen with the ferrite-bead connection comes up if you have any very fast signals crossing from one side to the other - these can put enough impedance in the loop so as to start to screw up reliable signal communications. On one board I recently worked on, we wound up with simple wire jumpers in place of the ferrite-beaded ones - it seemed that just the little bit of wire provided sufficient inductance to hold down the high-frequency noise we were troubled with, but not enough to separate the two grounds significantly for the fast logic signals. Leave yourself several options - places for jumpers, etc., and you might even consider hooking the two grounds together via some fairly heavy traces, which could be cut to go from a single ground plane to separate planes.

/* Written 2:31 am Aug 9, 1990 by jdg@hpqtdla.HP.COM in m.cs.uiuc.edu:rec.ham-radio */
>>Now we have two grounds internal to our circuit board.
>>What do we do with them?

>Tie them together at the power supply, or as close to the power supply as
>possible.

You might also want to put chokes on the supply and ground lines
between the power supply and the analog side of the circuit. The size
of the chokes, or the design of an RLC filter, will have to be chosen
according to the frequency distribution of the noise that you're
trying to eliminate.

I often use something like

+---- Digital +5
|
+5------+---- 100 ohms ----+---- +5 to analog components (3130,
| ADC0808, etc.)
10 uF and .01 uf in parallel
|
GND-----+---- 100 ohms ----+---- Analog ground
|
+---- Digital ground

Add similar stuff for +12 and -12 if you have them. This is all fine
if all your analog stuff is ultra-low-power; the extra hundred ohms
doesn't make a difference. Since I use 3130s, 3140s, TL08x, ADC0809,
LF11201, and similar MOS parts quite heavily, I don't hasve to worry
much about having a low-impedance power supply.

> <MULTI@TRIUMFcl.bitnet>

Methinks you want the FT-101EE rig. This is what I have. The three
models (at least as of the date on my manual) ate the B, EE, and EX.
I know the EE has all the bands (the B and EX lack some I think),
but I'll have to look in my manual in order to tell you what all the
differences are. There's a nice table listing various features/bands,
which rigs have them and which don't. I try to drop you mail this
evening listing the info.

I don't think the CW filter came stock on any of them; mine has it,
but the manual gives installation instructions. Try Fox Tango for
the CW filters.

I gather that you're considering the purchase of one of these rigs? If so, here's some info on going prices in the central New York region. I bought my FT-101EE for $390, mint condition (looks like it just came out of the shipping carton), good finals, plus a set of new finals and CW filter. Only problem: one xtal bad, replacement cost $5 plus shipping from Yaesu. I got a 300 watt Drake MN7 matching network (with SWR/power meter) with it for $80 additional.

At a hamfest this past Saturday I saw an FT-101EE for $375; it was in "fair" condition cosmetically. I also saw an FT-101B at $325. It was cosmetically "poor", and looked like it had had several of the front panel switches replaced with non-stock switches.

Good luck! The FT-101's were (and are) great rigs.

While there probably has been some whining on the subject, there has also
been legitimate questions as to why CW, out of all the various communication
modes available in ham radio, is considered necessary. I accept the fact it
is needed due to international treaty, but have yet to hear any other good
reasons.

Source record: 9367

Well, this certainly seems to address alot of of the issues surrounding cellular phone service. Kinda kills the objection about cells getting knocked out during natural disasters, doesn't it? As a friend of mine observed dryly, "if we have a natural disaster that makes it impossible to talk to an orbiting satellite, a 2 meter HT probably ain't gonna do much good either. We're talking serious atmospheric ionization here." :-).

Anyway....

In anticipation of the "it'll never work" discussion that I know (and the reader should know) is coming, I would like to present today's Top 10 List with apologies to Late Night with David Letterman....

From the Home Office in Scottsdale, Arizona....

Top 10 Reasons Why Hams Think Motorola's Iridium System Will Never Work...

10. Can't buy equipment from major Ham equipment manufacturers.
9. All those 900 numbers lead to undisciplined use of spectrum.
8. No allowance for use of CW in "high noise" environment.
7. Uses "evil" DSP techniques.
6. Not available in HeathKit version.
5. No exam required for upgrade.
4. Wrong numbers won't understand when you shout "CQ DX" at them.
3. I TOLD YOU this would happen when QST did away with "The World Above 900 MHz!"
2. It's yet another example of the "appliance operator" mentality.
1. Takes all the "challenge" out of global communications.

Flames to /dev/null please.

About a year ago, a version of Morse Tutor was posted out on the IBM-PC binaries group. Unfortunately, I seem to have lost the d*&n disk where I had the archive stored. Can someone please tell me if an archive is available for this via anonymous FTP? Thanks in advance!

Oh, if you are interested, there is a DXTRAKER posted out there recently that I just tried out and it works really nice... a Windows format with DXCC information built in (and can be updated), keeps tracks of which zones and countries you have worked by band and mode, allows for printing lists and such.

> This is certainly a most creative use of statistics.

Others also complained of my lack of statistical rigor. I admit to not considering the code/no-tech and tech/no-code combinations, since there is no US experience (see below). I omitted one or two no-code/no-tech (unlicensed) people from the AMSAT and CSVHF numbers, sorry.

I suspect that the data, not my lack of rigor, displeases you.
I don't think I ever claimed that high-tech people are ATTRACTED to ham radio by the 13- 20-wpm CW requirement, but I do think that I demonstrated that amateur radio technical leaders usually are proficient in CW.
Are you unwilling to concede this?

I had expected that Technicians would show up in much greater numbers.
If I had found that any substantial number of the technical leaders were Techs or Novices, I would agree that CW is so offensive to techies that they just learn the barest minimum CW and it is a serious hurdle. Do you suppose that the distribution is bimodal - most high-tech hams find CW no big deal, but most high-tech non-hams are kept out of ham radio by the code?

The British have issued no-code licences since 1964. Has their no-code licence brought in a lot of techies? I looked through the Feb, Mar, Apr, May, Jun and Aug 1990 issues of Rad Com (the main G ham mag) (can't find July) and find the following breakdown of authors of their (generally good) technical articles:
Class A (code) 18
Class B (no-code) 1 (~ half of all G's are Class B)
Unsigned Q&A Article 1
Also, the Brits are so concerned about the aging of
THEIR ham population that they have announced Novice licencing.
I'm not convinced that the British no-code licence has brought in either:
1) lots of young people, 2) lots of high-tech people.

I'm trying to convince GTE California to change our repeater's phone patch line from a business rate to a residential rate. Does anyone have any ammunition to bring to bear that I can use in waging this little war? Currently, they claim ignorance on the issue. The operator I got there had to refer things to her supervisor and claimed it would take at least a week to research the issue.

Thanks for any input, FCC regs, whatever.

^^^^^^^^^^^^^^^^

Yes they do, pretty strict ones at that... But they, like other gun control laws only effect the law abiding citizens. Do some research into the Stockton massacre, and gang warfare.

>--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
><phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

But back to the subject... On a recent trip to the bay area, I got a heavy dose of the "private" rptr nonsense. I won't go into the details, (I don't even want to remember) but I will never bother carrying a radio to Ca. again. For the same reason & others, I will never live in Ca. if I have any way to avoid it. I know there are good hams in Ca. (many I see on usenet) However, it appears that the ham resources there are dominated by a different type of ham, and it is tolerated.

It is amazing to me that in every other state I have operated in, that common sense prevailed. A rptr operator can make it difficult to use his machine, can turn it off at will, etc. .... But he cannot say "You cannot talk on this freq".

Personally I feel once he turns off his machine, he has vacated the frequency.

I do not agree with malicious interference, but using a freq (input or output) that is *not in use* is not malicious interference.

I take this approach on my machines, and expect other operators to do the same.

I bash NJ alot, but even they are better in this aspect.

Durnit!!! I allready spent more time than I feel this subject is worth. Oh well!

John, I agree 100% with your EMP posting. I would like to comment about number five on the CW hit parade however. The reason CW appears to be better between speakers of different languages is that the number of words sent is restricted to a small subset of internationally agreed upon signal abbreviations. Once you get beyond "UR 599 HR OM PSE QSL" the language barrier reasserts itself. This is rarely noticed on CW since so few words are exchanged, but quickly becomes apparant on a mode with a higher thruput such as RTTY or voice. Note that RTTY solves the "accent" problem but not the content problem.

> Are you unwilling to concede this?

What your data shows is that those technically oriented people who have already chosen to go ahead and take CW exam(s) to get an amateur radio license, have a tendency to graduate to the upper levels in a greater proportion than those who are NOT technically oriented.

But your data limits itself to those who are already amateurs. It is limited to what now passes through the narrow filter. It fails to address at all that which is blocked by the filter, namely those who refuse to become amateur radio operators because of the existance of the CW exam.

How many technically oriented people would become amateur radio operators if there is a codeless license class they can use? Statistics that answer that question would be useful. Yours do not, and I'm not sure we can even get such statistics very easily. Since the matter before the FCC deals with instituting a codeless license, statistics that are presented in that matter should relate to the impact of the decision the FCC commissioners are going to be making.

I don't know what else you are trying to say with your statistics.

> I had expected that Technicians would show up in much greater numbers.
> If I had found that any substantial number of the technical leaders were
> Techs or Novices, I would agree that CW is so offensive to techies that they
> just learn the barest minimum CW and it is a serious hurdle. Do you suppose
> that the distribution is bimodal - most high-tech hams find CW no big deal,
> but most high-tech non-hams are kept out of ham radio by the code?

First of all, the "difficulty" of learning the code may not be the basis that is causing technically oriented people from becoming hams. If it were, then I would agree that the random variation of capabilities would more evenly distribute the technically oriented hams over the CW speed ranges. I believe CW is not difficult, especially for technically oriented people. Your statistics and my experience confirm this.

What the problem is with the technically oriented people (and for many others as well) is the PRINCIPLE of having a test for a skill they just have no interest in using, and don't need for what they believe they are interested in doing.

Some technically oriented people will go ahead and learn the code. Some will readily do so because they actually want to use code, or just learn a neat skill. Others will just go ahead and do so because they evaluate the cost of learning a worthless-to-them skill in exchange for the benefit of the privileges and prestige of an amateur radio operator. Still others, however, will look upon the code exam in a negative way. Let me give an example be means of a conversation I had with someone once:

me: To get a ham radio license all you need to do is learn some things to pass some simple tests. You learn how radios work, how radio waves propogate, the FCC rules, and Morse code.

him: They still require Morse code?

me: Sure, but it's not hard to learn; I did it in just a few hours spread over about 4 weeks.

him: Oh, so what did that Morse code that just came over your radio say?

me: I don't know, I forgot my Morse code. I can't do it anymore, and in fact I never could do it that fast.

him: Why did you do forget it? Can't you just get faster with practice?

me: Well, because I am just not interested in Morse code. I am interested in some of the many other things in ham radio.

him: Then why did you bother learning it in the first place? It sure seems silly to learn something you know you are going to just forget.

me: I know, and I agree, but I had to pass it to get my license?

him: Why do they still require that test?

me: Well, there are a lot of reasons, but basically it comes down to the fact that the present hams don't want it removed.

him: Including you?

me: No, not me, in fact I am one of many who are trying to get it removed for at least one license class.

him: Why do the hams who want to keep it think it should be required.

me: You'd really have to ask them. I've seen many reasons.

him: Well, ham radio sure sounds like interesting stuff, but if they want to keep having that Morse code test, I'm not going to bother.

me: Why? It's really not hard at all.

him: Hmmm, maybe not, but it sure seems stupid to require something that you aren't going to use and isn't needed.

me: I agree with you, but are you going to let a little thing like that keep you out of ham radio?

him: Probably. If they still have the test then that means most hams
still want it; this is a democracy. I figure until they change
it just won't be that fun being a ham.

me: You could become a ham now and swing the balance to help get a
codeless license class going?

him: Naw, I'll just wait until better attitudes prevail.

me: But we need you now. We need your electronics background and
that kind of stuff.

him: Well, if you do, then change the requirements and get rid of
that stupid code test.

me: Do you think it would be too hard to learn? I'll help you.

him: That's not it, it's just the principle of the thing.

It is hard for me to address this issue because I don't know what form their
no-code license class takes.

Does class B allow for ALL privileges that a class A license allows for
above 30 Mhz with no exceptions whatsoever?

How many of those 18 authors STARTED with a class B license?

How many of those 18 authors would not have become licensed at all had
there been no class B license?

What these statistics COULD show is one or more of:
1. That a no-code license won't attract people.
2. That people end up migrating on up from a no-code license anyway.
3. That the privileges of a no-code license cause inactivity.
4. That the privileges of a no-code license are inadequate.

But which are correct? It will take further statistics and study to
determine this.

>
>3) TV sets can easily handle signals on adjacent channels, if their strengths
>are about the same. This how Cable TV channels are set up. 16,17,18,19,etc.

Cable uses a carrier phase lock technique to make this possible. The cross modulation that does exist is not nearly so visible if all the carriers are locked together. This also means, by the way, that the channels are not on their FCC assigned centers, but the AFC in the set can handle it. Generally in the broadcast case signals are coming from various distances and at various strengths so this technique is not helpful.

>
>5) There are so many empty UHF channels since the FCC is protecting poor sets
>from all sorts of their own flaws: (from a few-year-old chart)
>IF beat 20 mi. spacing 8th channel higher & lower
>Intermod 20 2nd thru 5th channel higher & lower
>Adjacent chan. 55 1st channel each side *
>Oscillator radiation 60 7th channel higher & lower
>Sound Image 60 14th channel higher & lower
>Picture image 75 15th channel higher & lower
>* The FCC doesn't make an exception for co-located stations.

Signal strength at a given receiver can vary from a millivolt to a few microvolts from one station to another in a market. The FCC spacing rules attempt to give enough protection to the grade A service contours to yield a S/N ratio of at least 42db. Most broadcast equipment is designed to have at least a 60db S/N ratio. Home viewers rarely see this good a picture. Receivers are getting better all the time and the FCC is reviewing the spacing rules in their "dropin" proceeding.

Consider that our coordinating body won't allow adjacent channel (20khz) 2 meter repeaters spaced less than 50 miles apart. Even this spacing causes annoyance to operators using either repeater who happen to live midway between them. Many consumers are unwilling to pay as much for the additional selectivity in their TVs that is offered by our expensive radios. And when they see additional interference, they'll blame it on those darn hams anyway.

Most technical decisions that were made about broadcast TV were driven by the political goal of delivering as many minimally acceptable pictures to the public as possible at the absolute least cost to the consumer. Adding $30 cost to a $69 portable TV so the hams will be happy is not a realistic goal.

Class A licence is obtained after passing Regs/theory exam and 12wpm code.
Class B licence is as above less code exam.

> Does class B allow for ALL privileges that a class A license allows for
> above 30 Mhz with no exceptions whatsoever?
Yes. The Class B licence is identical to a Class A licence with the addition
of the words "those licenced under an Amateur Radio Licence (B) may not
transmit on those bands between 1.810 and 29.700 Mhz".

Indeed Class B licencees are permitted to transmit morse but identify by voice.

I started with a no-code licence (GM8IKT) then "upgraded" to class A after a
year. My interests were still with 50Mhz and above though. I found CW useful
for Aurora-DXing and low signal 144Mhz work.

Regarding the Class B (no-code) licence in Britain, Phil Howard asks:
> Does class B allow for ALL privileges that a class A license allows for
> above 30 Mhz with no exceptions whatsoever?
One exception: (quoted from RSGB 1990 Call Book)
"When using morse code, you [Class B operators] are still required to
identify your transmissions in telephony in the usual way
because your morse cannot be guaranteed to be readable."
There were additional restrictions until perhaps 10 years ago (no use of cw).
I know of no other restrictions on Class B licencees; do any of the G readers
of this net?

> How many of those 18 authors STARTED with a class B license?
This is, of course, impossible for me to determine in the general case.
HOWEVER, the calls of the authors of half the "Class A" articles show they were
licensed before the first British no-code license was issued in 1964. Now you
see why the worry about an aging ham population. At the present, no-code calls
are being issued at about twice the rate of Class As (and the Class As
include all upgrades, since a new call is issued).

> How many of those 18 authors would not have become licensed at all had
> there been no class B license?
See above.

As quoted from <9008101350.AA19126@tilde> by dube@cpdvax.csc.ti.com:
+---------------
| and the only whiniong I have heard regarding no-code is coming from the new
| toots who are too lazy to learn code.
+---------------

I've heard more than that. And precious few reasons for keeping code that don't wind up being what you said above.

Real reasons, please. "I had to, so you have to, too!" doesn't cut it unless it's actually *meaningful* within the hobby --- *all* *parts* of the hobby.

For that matter, I haven't seen all that much sense on *either* side of the debate. Some, but it's buried in tons of knee-jerk rhetoric.

>Has anyone still *got* any of this gear? Does it work? Mine does.

I can. I keep (and maintain spare parts for) a PAIR of TCS-13 transmitter/receiver units (purchased for $10.51 EACH in their sealed water-proof bags from DoD Surplus in about 1970!) Working with a dynamotor "whining" in the background is interesting, but the TCS cables are pretty long...

Internal mods to both replaced the link coupling with a pi network. Both also have SO-239 connectors. I removed the AM stuff from one transmitter and reworked the circuitry to give about 150 watts CW (the old carbon mikes aren't much good, anyway). 1.5-12 MHz continuous covers 160-, 80-, 40-, and 30-meters.

Real radios glow in the dark.

I just heard DOVE on my HT for the first time. It was all packet. As I was made to understand, DOVE also carries a voice transponder. If this is so, is the voice transponder active? What times if any does it transmit? I am not set up to receive packet so it would be of more interest to me to hear the voice transponder. If anyone can provide me with more information, I sure would appreciate it!

From: ccsis@gdt.bath.ac.uk
Message-ID: <1990Aug11.173930.2324@gdt.bath.ac.uk>
Source record: 9297
Cross-posted to: talk.politics.mideast,rec.ham-radio,rec.ham-radio.packet

Are there any support groups for the families of people who have been trapped in the conflict in Kuwait? In particular are there any sources of hard information on what is happening to the people who have been moved out of Kuwait into Iraq?

Is Kuwait still active on Amateur Radio, or have all the stations been closed? Is anything coming out of Iraq?

Please send mail, and I will summarize.

382. Yuppies, celltels, hams, etc...

Newsgroup: rec.ham-radio
Date: 1990-08-11 17:40:00 UTC
From: PLB@PSUARCH.BITNET
Message-ID: <4F68192E981F00109C@PSUARCH.Bitnet>
Source record: 9291

I sincerely apologize to all those whose feelings have been hurt by my recent postings. To my defense, I only have to say that I was not aware of any "taboo" subjects that may have existed on this net (BITNET) by open or tacit agreement among its members.
(Brian, can you send me a list of all the do's and dont's... thanks)

I will continue to subscribe and post to this newsgroup as I see fit, until told otherwise by the ruling authority, or until the noise level will exceed my disk capacity... I will use more tact, of course, but I will not cease to look for FACTS.

To those who have written to me privately: thank you. Your comments have been most helpful in trying to understand your hobby and its position in the everyday life of many non-hams like me.
I will reply to you individually as time permits.

To Jordan (n5qvi, The Ohm Boy) and Chris J. Davis (chris@locus.com):

Thanks for nothing. I hope you feel better now, having let your frustrations out. Glad to have served as your lightning rod... no need to thank me.

Rest assured that my admiration for those in your hobby who work for its advancement is unshaken. I can still discern between comments made in a dubious state of soberness and the mature, balanced comments made by others.

No, if and when ham radio will "lose" any bands, it will not be because of the presumed yuppies like me (whatever that means), but thanks to the inability of those like you to come to grasp with reality.
You will then have to face your fellow hams... good luck.

Just for the record, and not because it matters that much: no, I did not attend an Ivy League school, and no, I'm not a yuppy (again, whatever that means). I'm ready to bet that you spend more on your radio equipment than I do on my cellular phone...

>Yes the R1 does have 10 scanning banks with two frequencies, tuning
>step and receive mode settings for each bank

But the R1 doesn't have "banks" for the memories. There should be at least 10 (and maybe more) banks that cover (possibly user settable) contiguous (possibly overlapping) memory channels, so that the memories can be programmed according to services. In this way, one can select whether he wants to listen to 2m, 70cm, the police, fire, etc., without going through all the memories and enabling/disabling each memory; instead the banks are enabled or disabled for scanning.

Icom did a lousy job of designing the user interface for this radio. With the microprocessor power that is available now-a-days, for less than $0.10 (an 8080 with a couple of k would be more than powerful enough), Icom has no excuse for their poor performance. Either they haven't done their marketing research and they don't know what the consumers want (a highly likely possibility), or they can't find competent computer engineers to do this work for them. On the other hand, maybe they know what the customers want, but they are purposely not delivering, in order to have something to do for next month's model. This last possibility, in my mind, is unforgivably despicable.

Good to see you got the hang of the idea of encoded serail numbers to
confirm exotic dx qso's. I agree it would still enjoyable to collect wallpaper (QSL cards
that look pretty or exotic) but with current
technology there is no reason to have to wait upwards of two years for
qsl cards to confirm a badly needed country.
It seems to me part of the fun would be to figure out an algorithm which would do the job
-- and quickly. In addition "electronic QSL
cards" do not require SASES or IRC. For that matter those exotic
DX-expeditions which will not use the buro might welcome something of this
nature. As for the delayed throughput during an expedition - one
could consider it to be similar to a SS/Sprint/WAE, etc contest. It
takes more skill to copy information in addition to a quick rst (Hi!).
Keep those cards and letters (e-mail's) coming.

Source record: 9296

During the late 1970s, the Japanese radio companies began marketing HF rigs much more actively in the US. With the combined markets of the US and Japan, they took advantage of the economics of scale, and produced good radios at a bargain price. Collins and Drake were producing rigs of better quality, but they couldn't match the price, as they did not want to market in Japan. Once the sales of their rigs dipped below a certain level, they bowed out of the market, proclaiming the market to be too small. Drake continues to produce consumer electronics, and Collins (swallowed up by Rockwell) still produces radios for government and aircraft markets.

This one should be easy. GTE has adopted a nationwide policy that all
amateur autopatches are to be charged at the residential rate. About all
I can suggest is that if you don't like the answer you get, keep going
up the hierarchy until you get an answer you do like. Get everyone's
name along the way. If a manager tries to stonewall you, a letter to the
president of GTE - threatened or actual - works wonders.

Oh, but your ground mounted vetical probably induces RF into the house
wiring, so the dummy load test isn't a good one.

Try a big choke on the 117 VAC power lead for the TV and VCR. Just get
a large toroid, and wrap the line cord around it. This may make the
line cord short enough that you need to plug it into an extension cord.

Someone wanted to hear some arguments AGAINST no-code. We'll, I've heard a
few attempts, and I shall summarize:

--- International agreements require a Morse Code exam.
--- Morse Code is a tradition in Amateur Radio.
--- Morse Code will keep the "riff-raff" out of our bands.
--- CB and GMRS is available for people who won't learn Morse Code.
--- A No-Code license just lowers the requirements for a license.
--- Morse Code ensures that only the dedicated will get licensed.
--- Morse Code is easy to learn.
--- 5 WPM is not a barrier for anyone seriously interested in ham radio.
--- Studying Morse Code exposes new hams to a mode they might like.
--- Studying Morse Code forces discipline on new hams.
--- Morse code is necessary for emergency communications.
--- We need a trained pool of skilled CW operators.
--- Morse Code is necessary for the National Traffic System.
--- Morse Code can get through when other modes cannot.
--- CW is the most efficient mode.
--- A CW transmitter is simple enough to build in an emergency.

--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
<phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

397. Re: A New War?

Newsgroup: rec.ham-radio
Date: 1990-08-12 07:18:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500673@ux1.cso.uiuc.edu>
Source record: 9304

And now for the rebuttal:

--- International agreements require a Morse Code exam.

This arguments fails on two counts. First of all, the actual wording of the agreement is vague. It says "knowledge of Morse Code" is what is required. The second, and most important, is that the agreement applies only to licenses granting privileges to operate below 30 Mhz. Since the codeless license proposals only grant privileges well above 30 Mhz, this argument does not even apply to the proposed new license class.

--- Morse Code is a tradition in Amateur Radio.

This is correct. But every phase of advancement in Amateur Radio has its own traditions. The belief of many is still that good traditions are to be honored and respected, not shoved onto people. Morse Code has a place in Amateur Radio, and always will. The traditional license classes will still continue to require a Morse Code exam under most proposals.

--- Morse Code will keep the "riff-raff" out of our bands.

This is not likely to be so. There is already a lot of "riff-raff" in the Amateur bands. Hams have their bad apples, too. While some people who would be "riff-raff" might be turned back by a code exam, if they were interested in leaving the CB channels, they probably would be operating illegally anyway. We just lose a chance to turn them around.

--- CB and GMRS is available for people who won't learn Morse Code.

This is not true. The CB and GMRS services are not appropriate for technical experimentation; the Amateur service is clearly the place for such things. FCC rules part 97.1 spell this out very clearly.

--- A No-Code license just lowers the requirements for a license.

Since some proposals for a new license class increase the level of the written exam beyond that of the Technician, and grants fewer privileges than the Technician has, the argument is clearly false.

--- Morse Code ensures that only the dedicated will get licensed.

If someone is interested in Morse Code, the exam is no barrier to them. If they are not interested in Morse Code at all, then it is a barrier to them just as much as having to learn any other unrelated subject. Since many people intend to not ever use Morse Code, then it is just as unrelated to them as learning how to drive a team of horses or pilot an oil tanker around ocean reefs.

--- Morse Code is easy to learn.

Clearly this argument, which is truthful for a large number of people, is a contradiction to the argument that the Morse code exam helps keeps out "riff-raff". Many things are easy to learn, but no one is expected to learn everything. Just because something is easy to learn does not say why it must be learned.

--- 5 WPM is not a barrier for anyone seriously interested in ham radio.

Neither is a written exam on the technical characteristics of packet radio, but we would not expect to force everyone to learn these things even though most hams could if they just put their mind to it.

--- Studying Morse Code exposes new hams to a mode they might like.

Studying anything can expose anyone to something new and exciting. Why must Morse Code be singled out to force everyone to be exposed to it, and other modes don't get similar exposure? People can be exposed to everything by just participating in Ham Radio itself. If you turn someone away immediately, then will never have a chance to become interested in anything particular in ham radio. The testing process is not supposed to be an advertising and brainwashing process for new recruits.

--- Studying Morse Code forces discipline on new hams.

Far more discipline, and useful discipline, is learned by actual radio operation. Would accept someone who passes all the test elements for the Extra class as a ham if they decided that they didn't need to even operate and are fully skilled already as a ham? Of course not.

--- Morse code is necessary for emergency communications.

More communications is now taking place in other modes, and many hams, including an increasing number of Technicians, don't use or are even capable of Morse Code operation. Emergency communications still take place, but use primarily voice and packet modes.

--- We need a trained pool of skilled CW operators.

For what purpose? There will always be a number of people interested in operating (and thus learning) Morse Code. Why is it necessary to train everyone, when most of the people who would be licensed under the new proposed license class would just forget the code if they had to learn it otherwise.

--- Morse Code is necessary for the National Traffic System.

More and more traffic is now passed by packet radio, and much is still passed by voice. This is not to say that Morse Code is not contributing, but rather that its not the only thing around.

--- Morse Code can get through when other modes cannot.

Sometimes this is correct, but even if it were always, it does not explain why everyone has to use the mode. More can be said with voice. You can see things better with ATV. These arguments are truths, but do not apply to requiring hams to be involved with, or learn how to use, any particular mode. I could just say "one plus one equals two so therefore..." and assert anything I wanted using that kind of reasoning.

--- CW is the most efficient mode.

This is false. The very reason that CW can get through when other modes cannot is due to its high level of redundancy. It is a narrow mode, but it is also a very slow mode. Efficiency in terms of the information conveyed for a given bandwidth in a given amount of time over a given distance is not Morse Code's great strength. It does have others.

--- A CW transmitter is simple enough to build in an emergency.

How many of you even know how? Is this even likely to happen? An emergency of the extreme that requires you to build your transmitter would require little more than just sending SOS, as you are going to be isolated somewhere anyway.

When I was in Dayton this year I noticed an HF xcvr which was strikingly similar to the ICOM IC-781 at the Hamvention. Does anyone know which came first ? Have we begun to copy the Japanese.
If anyone has the address of Signal One Corp. - I'd appreciate it. I'd like to get their catalog on the transciever and put it into my fantasy folder.

> The coordinator's authority ideally comes from the consent of the
> governed (sound familiar?). If the operators (not necessarily OWNERS)
> of coordinated repeater systems consent to the recommendations of
> the coordinator, there is no problem.

And the guy who is simply applying to get a coordination is one of the "governed". So who should be allowed to be members of the coordination group with voting privileges?

Also, just how the coordinators decide to arrange the repeater frequencies affects all of us who use the band.

> As soon as the bulk of the operators stop cooperating with the
> coordinator, they stop cooperating with one another by definition.
> They have only themselves to blame for their own mess. Too bad.

It's not their own mess.

What about the NON-operators who are so because they cannot get a coordination? When they say "no frequencies are available" is it really true?

What is a reasonable way to prevent the necessity of creating yet another coordination group? Doing this is fundamentally a bad idea, but if the existing group won't respond, what else is there to do? (only CONSTRUCTIVE ideas wanted)

It sounds like, then, that class B licenses are being issued, but that both class A and class B numbers are way down. Neither class is bringing in the technical people. That's unfortunate.

What this shows is that there may be other reasons for the lack of young hams becoming licensed. I really cannot say what this is. It sounds like a reasonable no-code license is available.

Is the 2 meter band totally overrun by the no-coders?

>>]line is basically nothing more than a cop-out.
>> I'm sorry, Phil, but I have to disagree. Even a frivolous lawsuit can
>> cause one considerable trouble and expense.
>> Ask the coordinators in Texas what it feels like to be sued.
>Sue for what damages??

(Background: I was president of the Texas VHF-FM Society during the time
we were being sued.)

We were sued officially because of a choice of wording in an article in
our newsletter: we said that someone had received a citation from the
FCC when the letter they had received, which was for all intents and
purposes a citation, did not include that word.

The article discussed a situation where one amateur had allowed a
repeater group to operate a repeater under his callsign, and then had
revoked that authorization so he could put up his own repeater; this
resulted in a repeater war between the group and the individual. The FCC
was called in, and asked us who was coordinated. We replied that the
individual was, and the group was ordered to shut their repeater down,
which they did. End of story - we thought.

We published an article about the situation, and got sued for libel.
During what settlement discussions we had, though, the plaintiff
consistently demanded that we reverse our decision and coordinate his
repeater - a demand we found unacceptable.

>> While anyone CAN sue, the most likely people to sue in these cases
>> are the crackpots that are also the most likely to fight over
>> coordination matters.
>Sue for what damages???
>Seeking what relief?

Damages? They can sue for every asset the organization, and its
individual coordinator(s), have, on the premise that we damaged his
reputation. The plaintiff in our lawsuit left damages to be soecified at
the trial, but claimed that we had irreparably harmed his business.

Relief? He can demand that the coordinator do things his way.

John's right. Being sued is no picnic. It brought almost all of our activities to a screeching halt, because we had to do nothing that would jeopardize our position in the suit, or our financial status should we lose. We had to be very circumspect in publishing our newsletter and discussing the progress of the suit with our members, lest the plaintiff hear something he could use against us. We lucked out, in that we were represented by a good lawyer, Lanny Priddy, K5LP, who agreed to defend us for only his actual costs. The defense could easily have cost us thousands of dollars, which we would have been hard-pressed to recover, since the plaintiff had little in the way of assets - he had to change lawyers once during the progress of the suit because his first lawyer hadn't been paid.

Yes, the threat of being sued is a credible deterrent, whether Phil thinks it's a copout or not.

Gasp! You mean one of the most rabid no-coders here admitted that the code requirement may not be the only reason that young people aren't getting into ham radio? Be still my beating heart!

Maybe, just maybe, the problem lies somewhere else...like we're not making ham radio atractive enough to the younger members of society. Naw...that's too simple for the no-coders. Must be something else. Let's let the lazy types in anyway, and then we'll look for other problems.

>
>73, Dube N5PDK

Let's see, an entry level transmitter in 1962 cost $69.95. This was an Eico or Knight kit transmitter in the 50 to 75 watt input power class with CW and AM voice, crystal controlled of course. A decent new receiver cost about $150. A top of the line Chevy sedan cost $2000.

Today a HR2510 frequency synthesized SSB and CW radio costs $249 and a fairly full featured all band HF rig such as the IC725 costs $700. A Chevy sedan costs $28,000.

Looks like today's radios are already cheaper in real dollars than they used to be. I'd love to see a good $69.95 radio available today, but the chance of it happening is about as likely as 18 cent a gallon premimum leaded gasoline.

Now now. I am genuinely curious if these things have any kind of
overcharging protection such that one could just replace
something and get on with it.

The guy gave it to me because the bearcat (uniden?) repair place
he sent it to told him that he should just buy another unit instead
of spending money on fixing it. He said it would not hold a charge.

Well even myself who pulls off stunts like this with improper chargers
know that he can replace nicad packs and see what happens.
Why I didn't do this in the first place is beyond me.

Can any offer any helpful suggestion

409. News from Kuwait

Newsgroup: rec.ham-radio
Date: 1990-08-12 19:36:00 UTC
From: Anwar.Ghuloum@F.GP.CS.CMU.EDU
Message-ID: <650489819/anwar@F.GP.CS.CMU.EDU>
Source record: 9320

If any of you ham-radio operators hear of any news from inside Kuwait,
I would appreciate you contacting me. I'm mainly concerned about how
the civilian population is being treated.

thank you,
anwar

SB RTTYDX @ RTTYDXA $RTDX0810
RTTY DX Notes, 1of3, 8/10/90

RTTY DX Notes for Weekending 10th August 1990.
Part 1 of 3.
BID: $RTDX0810

The question has arisen, how long is a long time before you receive
your QSL card? Well if you are waiting for cards from a DXpedition
who worked about 30 or 40,000 contacts, i would say that a wait of
about 4 months would be a fair thing. But if you worked a DX station,
well that waiting time would depend on the delivery of the logs to his
QSL manager. And sometimes the postal service to outlandish places is
very slow. But then of course there is the southwestern European
station who tells everyone, if you want a QSL, please send green
stamps, but he never sends QSL cards. There are all kinds around
these days.

Our thanks this week go to G0ABI, I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG,
PA3DEB, TG9VT, UT5RP, VE3XJ, W2JGR, W6/G0AZT and the Tri-State DX
Association VHF packet cluster. Thank you all for your assistance.

QSL Information:

J42DIO will QSL via SV2XYT, Box 10728, Tesaloniki, 54110 Greece.

R0L/UA6XGL QSL via RW3AH.

RC8O/UB4MZG goes to Box 22, Schastie, 348913, Ukaraine.

YS1RJ cards go to Box 792, San Salvador, El Salvador.

TK/DL7HZ cards go to his home address.

VP2V/JH4IFF collects his cards from his home address.

5N0ETP via W6QLQ.

EA9MY via Box 368 Melilla, Spain.

VQ9RB is via WA4DPU.

TU1UI will QSL via WA8ZWR.

TY1PS is Peter Schultz, BP 06-2535, Cotonou, Benin.

Notes Of Interest:

J42DIO is a special call to celebrate 2500 years of a holy city in Macedonia.

JA2NQD will operate from Belau as KC6CW from September 13th to 16th, then from Yap as V63AN from September 16th to 19th. QSL to Box 5, Ninomiya 259-01 Japan. While JH1BNL will operate from the same places at the same time with the calls of KC6DX and V63AR respectively. QSL his operation to Box 73, Okishu 431-31 Japan.

JG1NBD will sign S79 Seyschelles, from September 13th to 17th. QSL to his home call.

JH1QDB, Kuni will sign JD1 from September 23rd to 30th. QSL to his home call.

KU9C, Steve, states that he is willing to act as QSL manager, house keeper, for any RTTY DX station that needs a manager.

GL DE DX1 (VK2SG).

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips
to VK2SG @ VK2AGE.AUS.AU, or via AMTOR on the VK2AGE APLINK mailbox.

/EX

412. lead-acid charging from automobile electrical system

Newsgroup: rec.ham-radio
Date: 1990-08-13 02:44:46 UTC
From: faunt@dustbin.cisco.com
Message-ID: <FAUNT.90Aug12194446@dustbin.cisco.com>
Source record: 9326
Cross-posted to: sci.electronics,rec.ham-radio

I want to charge and maintain a charge on a gel-cell from an
automotive electrical system. I think that one way to do this is to
hook up a low-voltage-drop voltage regulator IC in constant-current
mode for the maximum charging current (about 1.6 A in this case).
This will limit the current to the gel-cel to the maximum allowed
bulk-charge current if the gel-cel is deeply discharged, but allow the
gel-cel to be charged at a pretty high rate until it gets pretty full,
and then taper off. Do some of the battery experts have comments or
pointers to more information about this application?
Mostly this battery will be charged from an AC charger, but I would
like to be able to charge and maintain the charge in an automobile,
also.
thanx, doug

From article <5463@plains.UUCP>, by bezenek@plains.NoDak.edu (Todd M. Bezenek KO0N):
> Today I heard a rumor that extended receive vhf/uhf amateur radio
> equipment had been confiscated from the vehicles of radio amateurs
> in the state of New Jersey. Does anyone know of this sort of activity?
>
> I often wonder what a highway patrol officer would think of my
> Kenwood TM-701 dual bander, but I really do not know what would happen
> should one of those gentlemen take interest in it.

I wouldn't advertise it, if you know what I mean, and I think you do :)

I remember the time I pulled off to the side of I-195 near Freehold
to check my trunk lid a couple years ago. As I slid back into the
car, I noticed all these red lights flashing behind me on the
shoulder.

"Good grief!" I thought; I gave a 'what-for?' shrug
to the officer, who asked if I needed any help. I informed
him that I was just checking, and as he turned around to
walk back to his patrol vehicle, he noticed my MICOR control
heads and asked what they were for.

I replied that they were for the fire department in my home town.
He perked up "OH! You're with the fire department, OK! Bye!"

No problem!

I found this in comp.dcom.telecom and received the author's permission to repost it to these groups. (He's on the fringes of Usenet and can't easily post items.) He asked me to mention that although he sometimes writes professionally on related subjects, this is just a quick sketch of personal recollections about these stations.

Direct replies should go to Don at his MCI Mail address.

Coastal Telegraph Stations [Donald E. Kimberlin]

Date: Thu, 9 Aug 90 09:16 EST
From: "Donald E. Kimberlin" <0004133373@mcimail.com>
Subject: Coastal Telegraph Stations
Organization: Telecommunications Network Architects, Safety Harbor, FL

In article <Digest v10, iss547>, Nigel Allen writes:

>Before INMARSAT began to provide satellite radio service to ships at
>sea, the only way to send a message to a ship was through a coastal
>radio station, either by voice or by telegraph. (I think that teletype
>service was available through Rogaland Radio in Norway, but not in
>North America.) INMARSAT is quite expensive ($12 per minute from
>Canada), but even so coastal radio stations are closing down in the
>U.S.

He further says:

>... Western Union has filed with the FCC to shut down its coastal
telegraph station KFS ... and that ... WPA, WOE, WMH, WSL and KOK
>have already been closed down. No doubt some traffic that formerly
>moved through these stations now uses cellular phones.

And he asks:

>Does anyone know whether there were competitive coastal telegraph
>stations in a given market, or whether such stations had a local

>monopoly?

Well, I have to say "thank you" to Nigel for raising a question near and dear to my heart that caused an excursion back to a comfortable past career. I was prompted to answer the question in part from my personal library and experience, but also to get on the phone to have a very pleasant chat with my old Almer Mater of international shortwave radio, WOM at Ft. Lauderdale, FL. Here's an attempt at summarizing a lot of detail:

While yes, it is true that shore telegraph stations are retiring from the airwaves, and significant shifts are occurring. Maritime Mobile Radio using Medium Frequency and High Frequency radio is, believe it or not, still growing, and MARISAT/INMARSAT are far from supplanting it. And this in spite of some incursions by cellular radio as well.

First, we must make it clear. Until or unless there comes to pass a global form of radiotelephony like Motorola's IRIDIUM proposal, there are vast stretches of ocean reached only by HF radio or INMARSAT. My phone inquiry to WOM found them very aware of these developments, revealing they found that while some ships, mostly supertankers, bought into INMARSAT, the $10 (U.S.) per minute rate compares poorly with the $4.90 per minute of HF radiotelephone, especially because INMARSAT bills from the moment of connection while High Seas (HF) radio makes all calls person-to-person and bills only when the conversation starts. Apparently shipping companies come to this conclusion when they get their bills, and find that a call to the ship's steward for a one-minute talk results in a $100 charge while they wait on hold for him to be paged to the satellite phone!

What the WOM folk knew was that satellite-equipped ships use INMARSAT for hard-copy communications, running not only Telex but even PC's at 64 kilobits off the ship. That's what's killing the shore telegraph stations.

They're not all dead however, just shrinking back to meet reduced demand. For that structural background Nigel asked about, shore radiotelegraph stations in the U.S. grew before there could be any structure to their sub-industry, mostly as "company" stations. For example, the origin of TRT Telecommunications, today in Washington, DC, was as a 1912 ship and shore radiotelegraph operation of the United Fruit Company in Boston, using 1912's "highest tech" to direct shiploads of bananas to the best markets while enroute.

That expanded to using radiotelegraph to the plantations in Central America, and that expanded to TRT becoming the international telegraph (and sometimes international telephone) company of much of Central America; the entity on the other end of AT&T's point-to-point HF radiotelephone from the U.S. RCA, of course, made shipboard radios for many American-flag ships (remember that David Sarnoff, builder of the RCA empire, was first a Marconi Corp. ship's radio telegrapher.); the result was RCA building a string of shore telegraph stations for

its customers. And, the RCA shore stations operated radioteletype as a service to promote sales of shipboard RTTY gear. ITT got into the act by owning Mackay Marine, which competed with RCA for maritime radio equipment and services, and so had a string of stations, too.

There was no territorial or service monopoly. In fact, just the opposite seems to have happened, and caused some significant words in the (U.S.) Communications Act of 1934, to the effect that (sic) radio stations for public correspondence must accept communications and traffic from any mobile station, because the "company" stations had, in fact, refused to answer calls from (even distressed) ships of other companies. What developed from that point was an interesting form of competition of many years' duration. The shore stations did compete with attempts at camraderie and service in ways only telegraphers could understand. Imagine if you can, an unseen, unheard person on shore exuding warmth and personality via a telegraph key ... and they did.

Despite the shrinkage of the number of radiotelegraph shore stations, the remaining ones seem to be enjoying growth by picking up the slack. For example, WPD at Tampa, FL seems to still be going strong, independently owned as it has always been, handing its traffic off as domestic telegram and Telex messages (that have now largely become E-Mail with PCs). One of the other "company stations" that never operated maritime traffic, the Trans-Liberia Radiotelegraph Company (built by Firestone solely to communicate with its plantations in Liberia) seems also to still be in business from Akron, Ohio ... but has been off HF radio for many years, and is now largely a message center with a couple of PCs ... but you could, if you wanted to, send a telegram to Liberia via Trans-Liberia!

As to the telephone business, INMARSAT, as noted, may have made some market, but it seems to be rather insignificant to WOM and it companions. Their market still grows. AT&T has operations at WOO near New York, WOM near Miami and KMI near San Francisco. The single most significant part of the traffic is cruise ships, that enjoy handsome profit margins on phone calls to shore for passengers. It's known that one cruise line tells passengers they are on satellite, and charges $30 per minute, while putting the calls on HF radio (yes, HF can sound mighty good, running SSB radio with Lincompex) where the shore station charges $4.90 less a $1 "commission" to the ship!

The surge of technology has helped, with $800 SSB transceivers, so that small ships and private yachts get on HF radiotelephone, too ... not wanting to pay the price of a satellite shipboard station and then the per-minute rates. They have fueled the surge in minutes, along with ... of all things ... aircraft! The WOM folks handle a fair amount of calls for private aircraft, notably some Venezuelan oil company planes that travel from South America across the Atlantic and Africa to Saudi Arabia. Some few "hep" international airline captains have even found their HF transceiver can get them a phone call to home

while crossing the Pacific at 35,000 feet!

The result is that WOM alone of the three AT&T stations is handling about 700 revenue-producing calls a day. And, the traffic of the one privately-owned U.S. station for international telephone traffic, WLO at Mobile, Alabama seems to also be healthy.

The standards bodies seem to sense this growth, for in 1991, the channel assignments for HF maritime radiotelephone use will be restructured again, with narrower channel widths (2.8 kHz) to create more channels.

As mentioned earlier, the sub-industry is restructuring, in some cases with technology old-timers could never comprehend. A major change has been and continues toward automating and reducing overheads by consolidation. As I write this, work is underway to consolidate the control point for NY's WOO in the WOM control room at Fort Lauderdale. Similarly, the local telcos who always ran the medium-frequency (2 mHz) Coastal Harbor operations abandoned them with demonopolization, and WOM took over Miami, Jacksonville and Charleston, SC, running the whole works with the WOM callsign and 10KW transmitters, while the receivers along the shoreline are wired to Fort Lauderdale.

The communications technology behind it is in some ways awesome, in others what we should simply expect. The WOM location in Ft. Lauderdale is 50 miles from its transmitters in Pennsuco, west of Miami, while the actual landline telephone operators all the ships speak to are in Pittsburgh, Pennsylvania! Not such a feat when you find out that the building is also AT&T's fiber POP for Ft. Lauderdale and WOM enjoys its own whole fiber route direct to Pittsburgh! Meantime, control of the transmitters is by PC messages shot around AT&T's packet data net to turn a transmitter on or off or change its antenna ... no clunky old "control circuits" at all; instead messages from a 3B1 UNIX machine (yes, they are planning to get 3B2s) that go on a packet network to be read by similar machines with control interfaces at Pennsuco (and soon, Manahawkin, NJ for WOO ... with KMI's Dixon, CA transmitters a likely addition someday).

And, HF radiotelephone even has its disaster function. During Hurricane Hugo's trip through the Virgin Islands and Puerto Rico last year, the first restoration of telephone connections to the U.S. was from ship radiotelephones there to WOM for several days. Of course, the world gets little news from the networks about such undergirdings of telecommunications. If people had wanted, they could have as well made phone calls into the U.S. telephone network (and thus the world) via WOM in the Mexico City earthquakes. FCC rules do permit doing ANYTHING with a radio transmitter if it is for the safety of life and property ... but that doesn't mean calling to see if Uncle Fred's attic window got broken, it means serious PUBLIC safety.

Oh, the cellular incursion. Yes, it's there, but again not that significant to a growing market. First, cellular of course, reaches

only incidentally a few miles offshore. There are automated VHF marine-band dialable shore stations that do reach seaward, but perhaps only 50 miles offshore. Run by a private company in Hollywood, FL, these similarly are remote controlled from that city, even though they range along the whole coast. And, in the Bahamas Islands group there are reported to be two cellular companies among the islands, Cruise-Phone and Boat-Phone. They serve an obvious purpose for boaters sailing among the thousands of Bahamas Islands, but only there.

Growth seems apparent in other areas, too. St.Thomas in the Virgin Islands has HF voice station WAH that is growing, as do several of the other nations' Caribbean islands ... French, Dutch, English and so on. And, of course, around the world, there are the established stations of many nations. The "territorial monopoly" is rather interesting when the Laws of Physics interfere. It's very difficult for nations to legislate what shore station a vessel calls ... even though some do force it economically, witness the Cuban shore stations with their own and Russian ships, plying the same waters, but never getting on the channels of the American stations, even though they easily can.

So, I hope this is the kind of response Nigel wanted. It's a peek into another galaxy of telecomm that most people don't even know exists or thinks is dead is the kind of response you wanted. From the figures I got today, it's another telecom business that grosses at least $15 million a year, and perhaps several times that.

And, since this peek got so long, here's a vignette learned yesterday from the WOM Technical Operator I chatted with. We were comparing stories about handling REAL emergency traffic, as anyone who has done that job has done, as he gave me a real side-splitter.

Seems he worked the third shift for a couple of years, and in the darkest hours of night, traffic tends to be nearly zero. However, one night at 3 AM, he heard a whispering voice on the speaker of his calling receiver saying, "Hello? Is anybody on here?" He lit up a transmitter and answered, whereupon the caller identifed himself as a ship and said, "We are under attack by the Indians!"

What? A ship at sea under Indian attack? What it turned out to be was s small freighter that had run aground on remote shoreline of Nicaragua, and the natives were boarding the ship and stealing everything in sight! Not daunted by this at all, the WOM T.O. called the U.S. Coast Guard District Office to find out what support was available, and within a short time the Nicaraguan National Guard was dispatched to quell the Indian uprising.

If you think, "Having that job must be a ball," you're absolutely right. Many is the time I've thought I should have stayed there. Pity it's only one that employs a handful of people. Oh, it's not a "secret" place although not in tour books. Located at the corner of State Road 7 and Sunrise Boulevard in Fort Lauderdale, just look up

AT&T Company and give 'em a ring if you want to visit!

[Moderator's Note: *Thank you* for a very interesting and informative article. I'm sure you are correct that this is a form of telecommunications very few people know anything about. I hope your article has educated a few of our readers today. PAT]

415. Re: Iridium Cellular Service

Newsgroup: rec.ham-radio
Date: 1990-08-13 04:27:31 UTC
From: john@anasaz.UUCP
Message-ID: <2874@anasaz.UUCP>
Source record: 9322

In article <205@bongo.UUCP> julian@bongo.UUCP (Julian Macassey) writes:
]Imternationally, the only reason for amateur radio is self training
]and experimentation. In most of the world "H&W Traffic" etc is third
]party and illegal as in "go to gaol". Modern telecommunications has
]long since outstripped anything we can currently do with 2 stations
]passing 3rd party on 20 meters. Think how much more traffic can zing
]directly to the recipients if you have 21 direct dial phone circuits
]rather than two tired radio ops passing messages to a guy in Atlanta
]who will try (possibly via telco) to get the messages to
]Pennsylvania.

Sigh. Here we go again. All I can say is that my experience
disagrees with your theory. There have been too many situations
that I have been involved in, both intra and inter-nationally,
where the authorities have asked for and gotten amateur help
in emergency communications. If we aren't needed for that, why
do they keep asking?

Sure, they could do away with us with ENOUGH technology, but they
don't have the budgets for that. On the other hand, since a pool
of ham operators is always present, it provides the buffer during
those rare occasions when there is a major emergency.

Furthermore, amateur radio has traditionally won many battles
BECAUSE of our emergency work. When we go up against others
in a governmental forum, our emergency justification seems
to almost always have a significant impact in the deliberations.
I watched an Air Force officer (non ham) show up, unsolicited, at a zoning
hearing to tell the local city council how the US government
considers ham radio a vital part of its civil defense/disaster
radio network.

You may be right about the international justification (although
I know of a lot of nations that have been very thankful for ham
emergency communications). You are simply dead wrong about the
politics of ham radio vs. the rest of the world when it comes to
emergency communications. I believe you probably mistake the
potential technical capabilities of available non-ham systems
for an existing OPERATIONAL capability. There is a HUGE difference.
]
] So yes, our internationally (as in WARC, ITU, CCIR) understood
]purpose is education and training. I really feel that the ARRL needs
]to get a grip on this.
]
] It's 1990 and even Pitcairn Island is on the phone.

]

In article <1256@ke4zv.UUCP> gary@ke4zv.UUCP (Gary Coffman) writes:
]In article <9008100012.AA04190@cmr.ncsl.nist.gov> rc@CMR.NCSL.NIST.GOV (Robert Carpenter) writes:
]>
]>3) TV sets can easily handle signals on adjacent channels, if their strengths
]>are about the same. This how Cable TV channels are set up. 16,17,18,19,etc.
]
]Cable uses a carrier phase lock technique to make this possible. The cross
]modulation that does exist is not nearly so visible if all the carriers
]are locked together. This also means, by the way, that the channels are
]not on their FCC assigned centers, but the AFC in the set can handle it.
]Generally in the broadcast case signals are coming from various distances
]and at various strengths so this technique is not helpful.
]
Well, actually the cable channels operate on the correct carrier frequencies
for the channel. It is broadcast TV that runs offsets so that a few
users in a fringe area between two channels ON THE SAME CHANNEL don't
get low frequency beats between the carriers.

However, the reason that cable requires phase lock is to minimize the
effect of cross-modulation in the cable TV amplifier chains. This
modulation builds up through multiple re-amplification of the same
signal. Broadcast receivers don't have this problem unless there
is a drastic difference in signal strengths and they don't have
good front end amplifiers and/or mixers. Also, the sound carriers,
which are also high power, are not harmonically related to the picture
carriers.
]
]Signal strength at a given receiver can vary from a millivolt to a
]few microvolts from one station to another in a market. The FCC spacing
]rules attempt to give enough protection to the grade A service contours
]to yield a S/N ratio of at least 42db. Most broadcast equipment is
]designed to have at least a 60db S/N ratio. Home viewers rarely see
]this good a picture. Receivers are getting better all the time and the
]FCC is reviewing the spacing rules in their "dropin" proceeding.

A TV receiver cannot get a decent signal with less than 1 MILLIvolt.
Cable TV delivers 0 to +10 dBmv (1 to 10 millivolts) to the receiver.
Signals of a few microvolts are not an issue.

]
]Consider that our coordinating body won't allow adjacent channel (20khz)
]2 meter repeaters spaced less than 50 miles apart. Even this spacing
]causes annoyance to operators using either repeater who happen to live
]midway between them. Many consumers are unwilling to pay as much for

]the additional selectivity in their TVs that is offered by our expensive
]radios. And when they see additional interference, they'll blame it on
]those darn hams anyway.
]
]Most technical decisions that were made about broadcast TV were driven
]by the political goal of delivering as many minimally acceptable pictures
]to the public as possible at the absolute least cost to the consumer.
]Adding $30 cost to a $69 portable TV so the hams will be happy is not
]a realistic goal.
]

We aren't talking about using the TV spectrum for ham radios. We are
talking about using it for public safety. The ENTIRE amateur spectrum
below 1 GHz is about the same as the spectrum usage of ONE UHF TV station.

R.L. Drake is still around. I believe they are still located in
Miamisburg, Ohio.

They no longer manufacture amateur radio equipment BUT they still
maintain a staff/parts for their equipment.

Their current product line deals with TV satellite receivers.

A friend of mine here has worked with them recently. If you need
their number, e-mail me.

I can uuencode the ZIP file, and then upload it to the newsgroup. However,
the last time someone did this (LOGGER) there were some comments stating
that these files shouldn't be distributed in the group. Who do I ask
permission to send it via uuencoded messages?

OK, I forgot that one. Actually I pulled up a list I made a few months ago for this, and that predated when you brought up your issue about the weak signal subbands and CW.

You say that morse code is essential for MOST weak signal communications at VHF. Do you know for a fact that MOST weak signal communications is done in CW or are you trying to state that morse code is essential even for those who operate only in SSB?

You say morse code is cost effective. Well I might very well have to agree with you here. But tell me the justification of why we have to FORCE people to use it, as opposed to letting them choose for themselves? Maybe I LIKE to give lots of money to Japanese radio manufacturers.

A most apt .signature!! Maybe there are TWO PROBLEMS keeping out the young and the innovative? Maybe there are MORE? I know that the requirement of code for NON-code-related privileges is a big turn off. I also acknowledge that other things can be concurrently causing the problem. In fact I am sure there are other things.

The Morse code exam is not the only ill facing ham radio, it's just ONE.

If we do have a no-code license class, it is obvious we still won't get anyone into the hobby unless we go out and promote it. But at least with a no-code license, the (first) big obstacle is out of the way.

> Maybe, just maybe, the problem lies somewhere else...like we're not
> making ham radio atractive enough to the younger members of society.
> Naw...that's too simple for the no-coders. Must be something else. Let's
> let the lazy types in anyway, and then we'll look for other problems.

Why haven't we been doing this? Haven't we had the opportunity to do this over the many years since ham radio's "growth" has failed to keep pace with the population and use of the radio spectrum. Please read my other posting with the conversation script. The answer is that it is the CODE TEST that has been making it difficult to make ham radio attractive.

If you'd just stop claiming that the only reason people are not getting into ham radio is laziness (there are some of them, though) and start looking at the problem, you'd see that there are other reasons, and many of them as well. Try addressing THOSE issues. If you come up with different solutions, let us know.

All the advertising in the world won't make very many people buy a product
they don't want.

> repeater - a demand we found unacceptable.

While any lawsuit is a serious situation, as Jay points out, this
particular case is not exactly typical of the kind of lawsuits I have
been hearing might be used as a threat against a coordination group.

First of all, there is a real deterrent here, and that is the deterrent
to PUBLISH. This guy technically was not suing you for your role as a
coordinator, but rather for your role as a publisher, and then using that
suit as a means to try to get something out of you in your role as a
coordinator.

> Damages? They can sue for every asset the organization, and its
> individual coordinator(s), have, on the premise that we damaged his
> reputation. The plaintiff in our lawsuit left damages to be soecified at
> the trial, but claimed that we had irreparably harmed his business.

Was the Texas VHF-FM Society incorporated? Every group should be.

What "business" did he claim was harmed? I'm curious.

> Relief? He can demand that the coordinator do things his way.

Even if you were found guilty of libel, I don't see how he can demand
that your role as a coordinator, and the public trust in it, be usurped
by him for "relief". Relief would be in the form of a retraction, and
whatever real damages are caused.

> John's right. Being sued is no picnic. It brought almost all of our

> lawyers once during the progress of the suit because his first lawyer
> hadn't been paid.

What was the outcome of this lawsuit? If this guy had little assets, then
what was this "business"? Surely not his repeater?

> Yes, the threat of being sued is a credible deterrent, whether Phil
> thinks it's a copout or not.

I don't deny that it is credible. The copout is when we do absolutely
nothing but bow to all threats. At that time, we no longer are making out
own decisions, but rather, someone else is making them for us. The problem
needs to be worked out.

First of all, I would suggest that a coordination group:

1. Have absolutely NO other interests or positions on anything.
If you publish anything, limit it to strictly the issue your
organization deals with (coordinating). Don't get into the
spectrum planning business. Let that be another organization.

2. Be incorporated in the state you operate in, and limit your
coordinations to within that state.

3. Allow anyone with a genuine interest to always work within the
organization.

4. By all means make sure the organization retains an attorney or two.

The weak signal portion of the band includes TWO subbands:

1. The CW-only subband (50.0-50.1 and 144.0-144.1)

2. SSB and FM portions.

I will accept that CW skills are relevant for the CW-only portion since that portion require you to ID in CW as well, and you had better be able to prove that you can do it, even if your computer dies. But 5 WPM makes it legal.

But the real problem here is with the SSB and FM portions of the weak signal bands. You keep CLAIMING that it is relevant, and you put forth only one flimsy argument that operators in these bands need to be able to switch to CW when you can no longer hear SSB through noise or distortion. This argument falls apart when you are dealing with people who are motivated to work weak signal operation in a particular emission mode.

My interest in working weak signal is in seeing how far I can carry voice or video, NOT in seeing how far I can communicate at all. Granted, YOUR interest appears to be in the latter. We should be trying to share the spectrum together. But look at which ONE of is is trying to boot the other out.

> the FCC regarding their ill advised no-code license, in which I urge

> to help any no-coder learn the code, and will welcome them into my
> favourite section of the band when they are competent.

It very MUCH is a "not in my neighborhood" issue. This is EXACTLY what that term means. You don't want them around you unless they CONFORM to YOUR particular interests.

> I believe that amateurs should be tested on any modes and/or techniques
> that they are privileged to use. If you can use packet, or rtty, sstv,

> or atv., etc., then you should be tested on these subjects on the exam.

1. This is just not going to be practical. Because the number of areas
is large and growing, the number of possible license classes to
represent this is staggering. If you have just ONE class of license,
and then have CW, packet, rtty, sstv, and atv, and endorsements, then
you have 32 different combinations right there.

The FCC has let it be known that whatever is done, it must work on
their existing computer system. That system is programmed to handle
6 different classes and has NO scheme for any sort of endorsements.

2. The fundamental PRIVILEGE is the right to use a radio frequency.
If radio worked in such a way that no one could possibly interfere
with anyone else, we would not need licenses, or even the FCC.
HOW we use that spectrum privilege is really not at issue to WHY
we are licensed. A radio signal can potentially cause interference
whether it is CW, packet, sstv, SSB, or whatever. Testing people
on such things as how TV works, or what packets are, has nothing to
do with being able to share the spectrum. These tests are just as
irrelevant as the code test. Testing should be strictly limited to
fundamentals of radio communication, and be done thoroughly.

...and if we promoted ham radio properly, people would want to get into
it badly enough that they'd want to learn the code.

This is the fundamental impasse. You claim that your buddy won't get
into ham radio because of the code requirement; I see it as he hasn't
been properly sold on the whole hobby. I seriously doubt that either one
of us will change the other's mind. Unfortunately, the FCC is on your
side, and will ignore anything I have to say on the subject. I didn't
even bother sending in comments on the NPRM, since they'd just be
ignored.

I grieve for what ham radio can be, and what it will become.

426. Low SNR Code Debate: K5ZC is in the numerator

Newsgroup: rec.ham-radio
Date: 1990-08-13 12:13:45 UTC
From: pescatore_jt%ncsd.dnet@GTE.COM
Message-ID: <9008131213.AA28790@bunny.gte.com>
Source record: 9235

Much as I try not to slow down on a highway when passing an accident, I've been trying not to add to the noise in the on-going, very low SNR code/no-code debate. However, K5ZC has recently made some telling remarks that hit my hot button: from the ham as a hobbyist perspective (not as a magazine distributor, national dues charging organization, or any other perspective that will profit from more hams), it looks like we need to decrease the average age of the ham population more than we need to increase the size of the population.

Why? Mainly to assure that in 35 years, when today's average 49 year old hams are croaking left and right, that the hobby that has been a big part of many our lives continues on. No other real reason, though I think it is a lot more fun talking to a 16 year old who is at a high school station than to a 85 year old at a retirement home.

Due to its use of the spectrum, ham radio will and should have barriers to entry. I personally think code is the least difficult of the barriers for primary school age kids to hurdle. I give ham radio presentations to Cub Scouts each year for their communicator badges (how apt!), and they generally are more turned off at a school-like written test than they are at learning code. Most of the people who are turned off by learning code would also have a problem learning a second language; most of the kids of the age that we need to attract to the hobby can pick up Spanish as easily as code.

I was opposed to no-code licensing for the same reason I am opposed to the capital gains tax reduction (pretty deep, huh?): they are both short term fixes applied to long term problems. However, I've sorta changed my mind on the communicator class license. It will probably help to keep us from losing more VHF spectrum, and my morning drive time show group can always go back to 10 FM for commuting blathering if VHF gets out of hand.

But, I am worried that if the new license does lead to an increased ham population we will lose sight of the long term issue of attracting young hams. KE3Z, if you do circulate any of these missives around HQ, I'm afraid the ARRL in particular will forget about the long term problem during the short term euphoria of increased QST subcriptions. When the league committee was working up its position, I send W2GD a note to the effect that no-code wasn't the solution to attracting younger hams, and maybe the league should spend a lot more time sponsoring high school stations and marketing amateur radio towards teens and pre-teens.

Marketing is the key. Apple has done a great job of getting its computers in front of rug-rats who will be decison makers before long. Amateur radio should do the same.

Hey, you guys (generic, non-sexual term) out there who work at game companies: how about a Dr. DX NINTENDO game? My son could learn CW in two days if he had to learn a character to get extra lives in each level of Super Mario Bros 3.

From what I have seen it appears that Nintendo is more fun than Ham Radio.
Kids are NOT going to get interested in Ham Radio unless we have something
which will get, keep and focus their attention. How many kids are still
interested in computer hacking anymore? My guess is that the number is
a lot smaller than 5 to 7 years ago; again, it's a matter of capturing
their attention and we don't have that pearl yet.

Attention radio shoppers..... Kenwood announced that they are begining a phase out of the venerable TS-940. No real replacement in that price range announced. They may not be planning anything in that range assuming that the 950 will pick up the slack. Also the TM-231, 431, 531 are being discontinued in favor of new models. See QST.

Kenwood also announced a new ultra small HT that looks like a "Space Communicator". More to follow later......

I think you may be on to something here. Perhaps the thing we need to get young people into ham radio is a distributed, virtual-reality gaming system done via packet radio. Nintendo and Mattel are doing well with regard to commercializing the VR stuff. If we could produce multiplayer gaming systems that connected via ham radio packet nets, I'd bet it would be hard to pry kids away. Witness the interest in multiplayer games on CompuServe.

To keep up the technical aspect, probably the right approach would be to define a multiplayer gaming packet protocol and distribute some sample characters or simulations that any ham could use along with source code. Publish it only on ham bboards at first so that kids become hams before they get access (you want to watch out for kids wanting to jump on without getting their license first).
Kids could then hack the code and try to improve their systems. Of course, some improvements would only be possible with more bandwidth, so some would move up in frequency into microwaves and above. Repeaters and repeater nets dedicated to gaming might result. Come to think of it, if this became popular, it might start crowding voice and normal packet. Hmmm.

Still, this is the sort of application that shows what can be done with computer-to-computer communication and a good multicast medium. And while it is very different from DX, it is very definitely recreational and noncommercial. Sort of like contests with a different thrust.

Some people. More people. Enough people?

>This is the fundamental impasse. You claim that your buddy won't get
>into ham radio because of the code requirement; I see it as he hasn't
>been properly sold on the whole hobby.

Let's take another example. Me. I've been proslytized by some of the best. My radio and TV instructor in college for one. Extra class. Meteor bouncer. Liked to play the world with 100 watts or less. He set up a special novice license class at the school. I'd finished the technical aspects and was at 2WPM when I decided it wasn't worth learning code -- I was having too much fun DXing my shortwave. That was Good Enough for me. Still is. (that was in 1980, by the way. I might point out that less than 50% of the people that started the class finished it. Of 24 folks, 11 got novice tickets, and 13 gave up partway through. 12 of those 13 gave up over code. Code was a problem 10 years ago...).

I've been proslytized since. The folks here at Apple are very open and very positive (Hi, Patty!). Phil and Bob Parnass and many of the folks here on the net set very good examples for Amateur behavior. That's nice. If the code requirement didn't exist, I'd consider joining up.

I bring this up because I am SICK AND TIRED of being called lazy. I am sick and tired of people saying that those of us who haven't learned code are lazy (or stupid, or pick your favorite attitude). I am sick and tired of being told that SWL is a second-rate hobby for folks who can't 'hack' being hams. Remember the SWL wars here before rec.radio.shortwave? Talk about proslytizing the hobby. For every Patty or Phil, there are a number of people who make Ham Radio seem about as interesting as boot camp. The *one* time I was stupid enough to walk into a Ham Radio Outlet here in the Bay Area was more than enough -- as soon as they found out I didn't have a ticket they were downright rude. If I'd been looking for help on getting a novice ticket, that would have been enough to convince me against it. I've listened to 2 Meter. I've listened to a number of the bands. Most of the time, it's rather hard to tell the difference between the annointed hams and the lowly CBers -- lots of noisy, hassling, USENET-like moaning. I should work hard to join up the flame wars that I hear out there? Like, what do I get out there that I don't already get here?

I'm not lazy. I was a month from finishing my code requirement. I could have done it -- I chose not to, and so did 50% of the class I was in. This was a class with a very good and motivating teacher. I can only imagine how well ham radio does under other circumstances (actually, from the statistics, I SEE how well it does).

Amateur radio has a LOT of problems. Code is just one. Worse, it is an arbitrary, unnecessary barrier. Hams should be worried about the state of Amateur radio. Instead, many spend a lot of time building silly, unrealistic excuses about why people don't join up -- if I knew nothing about Ham, I'd think many of them were talking about some kind of mystical religion.

Getting rid of the code barrier is just the first step. That removes that massive psychic wall from around the hobby. Once that's gone, it'll be MUCH easier to convince people to try the hobby -- if you go out and do a good job of convincing. If you don't, you can all sit around and continue making snide comments about us lazy twits who won't join and feel superior to us all you want -- until the hobby withers away and dies from lack of care.

Write me off if you want, Jay -- but I'm the kind of person Amateur radio should be trying to attract. It HAS tried to attract me multiple times and it's come close. But it's also successfully convinced me to spend my time and money and energy elsewhere because of all the hassles and the problems and the attitudes.

My opinion, as an outsider looking in (and as an interested and informed layman) is this: there are LOTS of problems in Amateur. Code is simply one. If all of the problems -- the attitudes and etc -- were magically fixed tomorrow, I'd probably think about learning code anyway. We know that's not even remotely possible. Removing code, however, drops a major barrier that makes the other problems more tolerable -- I'm not going to learn code to get into the problems, but I might choose to tolerate the problems to get to the good parts -- if code wasn't in the way.

There are good sides and bad sides to Amateur. Right now, frankly, the dark side is winning. No-code doesn't change that fight in any way, shape or form. It simply means that I no longer have to climb a cliff simply to get in the fight. Right now, the climb is steep enough that I'm letting the battle rage without me.

You're treating a symptom and not a disease here. By trying to 'beat'
computer games on their own ground, all you'll ever be is a second-rate
computer game.

The trick is to not try to compete with computer games by being one, but by
convincing people that your own game is even better -- being a Ham. So far,
hams have done a pretty poor job of that.

If you're born a banana, you'll never succeed by trying to be a peach --
you'll only be a horrible peach. Better to be the best damn banana in the
bunch and convince people that bananas are better.

437. Signal One `IC-781' Seen At Dayton This Year

Newsgroup: rec.ham-radio
Date: 1990-08-13 16:53:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9008131557.AA03639@ucsd.edu>
Source record: 9253

In a previous message, Richard Harel (4X1DA) mentioned that he had seen at Dayton this year "an HF xcvr which was strikingly similar to the ICOM IC-781". From his next comment, it's obvious that the radio had a Signal One name-tag on it.

I must have seen the same radio; Richard's comments reminded me that, at Dayton this year, my eye had also been caught by what appeared to be an IC-781 in Signal One clothing.

I stopped at Signal One's booth and chatted for a few minutes with the fellow manning it. As best I can remember, what we saw was (for the most part) a repackaged IC-781, that Signal One had contracted for Icom to produce, although I was given to understand that Signal One had Icom code some different software into the machine. I can't remember what (if any) hardware differences there were, between the Signal One version and the IC-781.

The radio was being built in very limited quantities, for some particular application. My recollection is that Signal One had the radio on display more as a `conversation piece', rather than trying to market it to Hamvention attendees. I believe it's price was somewhere in the $15K - $20K range.

I have actually been to their store in Preston en route between Colorado Springs to Boise. It is a downtown storefront in Preston and they do seem to maintain a large stock of things. They seem to be legitimate.

Richard,

I'm pretty sure that Signal One has been out of business for something like 10 years. There are a couple folks who service the rigs but the original company is no longer around. If I remember correctly they produced to rigs..the CX-7, then the CX-11. I'd guess the CX-11 was introduced somewhere around 1977. The rig was quite an innovation for its time, and so was the price tag...it has that in common with the IC781 too ;-)

Good idea Jim. I have now renamed the concept E-QSL or "Electronic QSL". I beleive that you are right about RS/RST. It seems to me that
amateurs are supposed to experiment with new communication concepts. If this can get off the ground it might prove interesting. All we need now is to have some help from a DXpedition and an awarding agency. Also, there has to be some work done to develop a public domain aglorithm which can be used. I guess it will also have to certified by an awards group. Keep your ideas coming.

THOUGHTS ON LICENSING

Full credit for this licensing plan is from
WA2DYA with my full agreement. Simple is best.

Have 3 yes only 3 license classes as follows:

Novice: Same as now - no change

Communicator: No CW test , operation on 50 MHz and up - new

General: 13 WPM CW test plus theory, all bands all modes-

modification to existing class

I'm looking in the National Semiconductor linear catalog and I see that the LM386-1 is rated at 250mW,min and 325mW,typ ... now there is an LM386-3 that will go: 500mW,min and 700mW,typ. That might be one solution.

Another might be to check pins 1 and 8 to see if there is an electrolytic capacitor attached. A 10uF cap here will increase the voltage gain from 20 (nothing connected) to 200 (10uF). Note that increasing the audio gain means a decrease in battery life.

I don't know which version radio shack is selling, but it might pay to go in there and look at the actual device (magnifying glass may be required!).

Great ideas doug. I sure think the idea of DXpeditions sending their
computer logs to award agency to be used for conformation is excellent.
Also you idea of perhaps having a 'clearing house' which supports many
expeditions and rare dx locations which would provide you with a official confirmation list
of you contacts for a small fee is good.
Still I think that experimenting with E-QSL's would be fun. You may be
right about legality of encoding a number - however with the support of
the ARRL/IARU and others this matter could be addressed - successfully,
I think?
Still I think that it may take some time to figure out a suitable
public domain encryption algorithm which will be FAST even on fairly
slow machines will take some time. Then there is the matter of convincing a DXpedition to
take the risk of trying out the idea
will be a separate matter. I suspect that they would have to
solicit the help of a number of Ham Mag's to feature articles which
outline what they are doing. This would mean plenty of forward planning. I sure would like
to hear more of your ideas.

From: alanr@tekigm2.MEN.TEK.COM
Message-ID: <9687@tekigm2.MEN.TEK.COM>
Source record: 9269

I have written a new database program for DXers and other people interested in HF operating called DX Tracker. A demo version of DX Tracker is available from the comp.binaries.ibm.pc net. If you are not familiar with downloading utilities from this net it can be a little confusing. If you can't find anyone at your site who has done it before, send me email and I'll try to help out. As you can tell, this program runs on an IBM PC/XT/AT.

DX Tracker is not a logging or contesting program. It provides many useful statistics for those folks interested in 5BDXCC or 5BWAZ. It is pull-down menu and window driven and allows you to track your country/zone count on CW/SSB for 160-10 meters and much more. Give it a try and see how you like it.

Perhaps a 64 bit encipher coded is not need to E-QSL - Electronic QSL's got an ideas?
I suspect that the level of security required to make an E-QSL
confirmation good enough for an award would be minimal. Perhaps
a 16 bit encipher code would be adequate. It would run faster and be
shorter to send.

First, thanks to everyone. There are some good ideas out there.

To clarify, I live in one of THOSE regressive neighborhoods that consider log-periodic antennas to be an eyesore, rather geometric art. I barely get by with the Butternut HF6VX, so putting an antenna on the roof is not possible. Otherwise, I would put the TV antenna below the ground plane to get rid of all the nasty RF. :-)

I'll try the 300 ohm hp filter to break the coax. I suspect common-mode on the coax, too. After I made the posting, I was fiddling with the coax and noticed my balun had a 75/300 switch on it. After putting it on "75", things improved. How embarrassing.

I don't think it's the 120 VAC, because I can watch a tape on the VCR without (much) interference. The VCR is a cheap plastic unit (purchased before I became a ham), but I've gotten good results by stacking it between a metal-encased tape deck and a metal-encased CD player. I'll add some more toroids and see if that improves anything.

I'd rather not add a preamp to the soup, because it can go nonlinear. Passive components have their advantages.. The picture is otherwise fine when I'm not transmitting.

I worked for Drake from 1976-1979. At that time, they were still manufacturing ham equipment. The competition from the Japanese was intense, but they were still making a modest profit.

Not long after I left, they decided to ratchet up the profit margin by dumping Amateur Radio and going into the Satellite TV Receiver business. They were quite successful at it.

Last I heard, that's what they are still doing. They do still service the old ham gear. Prices are fair and service is good, from what I hear.

>Some people. More people. Enough people?

I just looked up the figures the Dutch PTT gives about this (dated June 1990).
First: I described our licenses before, but a quick overview can't hurt:
We have 4 types, A, B, C and D. The total number of licensees is 14484.

The D license is the easiest one. It requires a simplified technical test,
no code requirements. D licensees are allowed to work on a part of the
2m band (only the cannelized FM part), using FM only, max 15 W.
There are 2916 D licensees.

The C license the the next one. It requires a stiffer technical test (it's
the same test as for B and A), and no code requirements. It gives all
priveleges above 30 MHz with 30 W max.
There are 6091 C licensees. (that is the highest figure)

The B license requires the same technical test as C, plus 5WPM code.
It gives the same privileges as C, plus full access to 10m, and CW only
access to a subband in the 15 and 80 meter band. Output 30 W above 30 MHz,
100 W in the DC bands.
There are 64 B licensees, so it's not popular apperently.

The A license is the 'highest'. It requires the same technical test as
C, plus 12WPM code. It gives full priveleges on all amateur bands, with
max 100W.
There are 5413 A licensees.

So, we have more code-less licenses as code-full ones. I guess a codeless
license will have success, looking at these figures.

BTW: upgrading from C is easy, just pass a code test to get a higher license.
All licenses are allowed to use some kind of CW, even if the're not tested
on that. D licensees using FM only, of course (FSK, AFSK). I know of people
using this possibility to practice before they take the code test.

Repeaters. Rules are easy: nobody is allowed to run an unattended transmitter.
Repeaters thus require a special license. These licenses are based on
coverage: the whole country is covered, but mostly only by 1 repeater.
We thus can work things out on 8 repeater channels, without subaudio tones.
Of course, closed repeaters are impossible.

Getting younsters in. A local well-known ham has proved several times how
this can be done: he showed what can be done with ham-radio on a school,
got a group together (members are 14-16 years old), gave weekly lessons
on the technical stuff, prepared the people for the exams, and helped
them on their first QSO's, giving them some operating practice.
Result: exam success rate of >90% (C license), and a whole group of
young, enthousiastic people helping each other, building antennas etc
in a group, and _very active_ on the whole spectrum of amateur possibilities.
These people are certainly not the worst kind of people occupying our bands;
I have more problems with some other people, with all kinds of licenses.

So, maybe this inspires you how it can be done. From a European look, the
American code/no-code discussion looks kind of silly.
I hope these figures prove why.

>for those who operate only in SSB?

If you're only having a pleasant chat with your buddies in the next state only 300 or so miles away, then SSB is usually effective, and it is usually used. However, if you are really pushing it, if you are trying to work a new grid, a new state, someone very far away, if band conditions are poor, or if band conditions are good but the station is so far away that the signals are almost buried in the noise, then CW is essential! I am arguing that since the whole point of weak signal communications at VHF and above is breaking records and pushing the state of the art, that CW should be required of all licensees that are permitted to operate in this section of the band. It is a very useful skill (indeed - here it is ESSENTIAL), and reasonable proficiency (~13 wpm) should be absolutely required.

>You say morse code is cost effective. Well I might very well have to agree
>with you here. But tell me the justification of why we have to FORCE people
>to use it, as opposed to letting them choose for themselves? Maybe I LIKE
>to give lots of money to Japanese radio manufacturers.

Cost effectiveness is not a justification for the CW requirement being levied upon licensees granted access to the weak signal portions of the VHF/UHF/SHF/EHF/etc. bands. It is just additional information that is relevant to the discussion at hand.

There is nothing implied in my statement about the initial costs of learning CW! It only refers to making weak signal contacts on the VHF (and above) bands with current equipment and techniques. You are reading something into my statement that isn't there.

Even though I consider "counting the cost" of initially learning CW ludicrous, let me propose a challenge based upon my interpretation of your above statement:

I take one suitably willing 15-25 year old, and teach him CW. Then he makes a simulated contact where a CW signal is only 0.1 dB above the noise floor of the receiver with 2.5 kHz bandwidth.

You take one suitably willing 15-25 year old, teach him all he needs to know about DSP, have him build his DSP equipment, and then make the simulated contact. You can change the bandwidth of the receiver, but then the signal-to-noise ratio of the simulated signal must be scaled appropriately. (I was very generous when I gave you 2.5 kHz!)

Simulated contacts will be used to keep everything on level ground.

My student will be done in short order, while yours will be busy for quite a long time. My point is that if you are going to consider the costs of initially learning CW (which aren't that great - about 15 minutes each day for 2-3 weeks), then you must also consider the costs of learning all of that DSP technology. This body of knowledge is considerable, as demonstrated by the fact that most electrical engineers with a bachelor's degree are probably not comfortable with it.

I will repeat my statement, with emphasis to make sure you understand:
Morse code is essential for most weak signal communications at

VHF and above, WITH CURRENT EQUIPMENT AND TECHNIQUES. It's also
the most cost effective weak signal communications mode with any
equipment and/or technique.

When did V31BB become a silent key? I heard him about 6 weeks ago. Perhaps this was the guy from Georgia. He talked a lot about how bad MFJ equipment was. He also said bad things about the ARRL. For a few weeks last May, he was the only guy I could hear on 10 meters.

By the way, is MFJ equipment really thay bad?

-I'm looking in the National Semiconductor linear catalog and I see that
-the LM386-1 is rated at 250mW,min and 325mW,typ ... now there is an
-LM386-3 that will go: 500mW,min and 700mW,typ. That might be one solution.
-
-Another might be to check pins 1 and 8 to see if there is an electrolytic
-capacitor attached. A 10uF cap here will increase the voltage gain from
-20 (nothing connected) to 200 (10uF). Note that increasing the audio gain
-means a decrease in battery life.

According to the service manual for the PRO-34, they are using the
LM386-1, and have a 2.2uF cap between 1 and 8. If I get a chance,
I may try changing both the chip (to the -3 version) and the cap to
10 uF.

If you own any RS scanners, it is a good idea to get the service manual.
Any store can special-order it for around $10 - $15, and it includes
schematics, board layouts and alignment instructions. (Actually, I
believe you can get service manuals for almost anything they sell...)

If only third-mates could pilot tankers, maybe 5-million-plus gallons of oil wouldn't be missing at the bottom of the Valdez bay. :-)

When I was in my teens, I learned how to pilot a ship. That knowledge is fairly useless to me here in Colorado. But what the hey, most things in life are useless or unrelated -- at least that's what people often say.

Hmmm, I do know how to ride a horse, maybe next summer I should learn how to hitch a team. Oh no, I just remembered, I don't like picking their hooves, yea that's right, picking the rocks and stuff from their hooves before riding is a real pain. Yea, there should be a no-pick license for horse-back riding. Yea, that's the ticket :-)

Mr. Bloom,
If you read my posting carefully you will see that I did not say
emergency communication had been removed. I said education and training
are part of international documents. Seeing as you want to put words in
my mouth, I will add that I am not aware that emergency comms are
mentioned in international docs. But you would know all that, because
you have access to a library that my fees pay for.

While I have your attention, let me say that I do not appreciate your
snide comments to me on an open forum. Also I am somewhat annoyed that
I should have to put up with impertinence from someone who is an
employee of an organisation that I support with my fees.

disappointedly yours.

So, tell me, how does "your" youngster make his contacts? Why is
it that "mine" would have to build his or her own rig and yours simply
go off and operate right after he has learned Morse?

In a very short time when (not "if", but "when") DSP proliferates in
the Amateur community, "my" youngster can become an appliance operator
too, and get on the air just as quickly as yours can.

Look, if "your" youngster wants to do marginal SNR CW, he can go learn
Morse to his heart's content. No one is stopping him. Some of us just
want to let in people who do not want to bother with Morse but can
contribute to the advancement of the hobby in other ways.

Moreover, you sure chose an arbitrary SNR, didn't you? Want to
change that to -10 db SNR over a 100 Hz bandwidth and see who gets
there first? How about -20 db? Unless you know something we don't -
if so, I must have wasted quite a few years of my past life solving
equations and designing DSP equipment for the SETI program. We
should have just built CW receivers instead, eh? We would have
been off observing much sooner with CW equipment!

Yeah, I know -- 20 WPM rotted my brains.

>go off and operate right after he has learned Morse?

Your youngster doesn't have to build his radio, just his DSP equipment. Oh, he has to write his own software also. If it will make you feel beter, I will have my youngster build a morse code key. Commercially available radios and transverters do not come equiped with either morse code keys, nor DSP equipment (for receiving very weak signals at very low baud rates).

>Moreover, you sure chose an arbitrary SNR, didn't you? Want to
>change that to -10 db SNR over a 100 Hz bandwidth and see who gets
>there first?

It was not completely arbitrary. I chose it such that contacts would not be possible using conventional voice modes like SSB, AM, FM, or ACSB, and such that contacts would be possible by both CW and DSP techniques. With your choice, the CW contact is not possible, and the challange is not fair.

This whole thing is ludicrous. My whole point is that with conventional (readily available) equipment and techniques, CW is indispensible for making weak signal contacts. It is the most cost effective mode with any equipment and/or technique. When CW is not possible, because the signal is below the noise floor, then other techniques should be used. I am not arguing against these techniques; I am only arguing in favour of CW, because of it's simplicity, because of it's great capability, because it is required for most VHF/UHF/EHF/SHF weak signal work, because of it's economy, and because it is very easy to learn. In my mind, CW seems to have a lot going for it.

I have to admit, that when I was first licensed, I thought I would never use CW. I didn't want to learn it. After I got on the air and became proficient (it took about 2 weeks at W8YY, the club station at Mich. Tech. Univ. to get up to about 10 wpm, and another 2 weeks to get up to about 20 wpm), and after I learned how valuable the skill which I acquired was, I changed my mind about the idea of a no-code license.

I am very opposed to allowing the no-coders into the weak signal portion of the VHF/UHF/SHF/EHF bands. It is obvious to me that CW will continue to be used for a very long time, even when the DSP equipment becomes available. I have a feeling that in addition to accurate clocks, good

frequency stability will be required. When you're really pushing it, like 76 GHz for example, frequency stability is very hard to come by. On the other hand, it is much easier to generate a signal up there, and to generate a signal at 66 GHz (for example) to mix the received signal down to 10 GHz (for example) where you can work with it. While the stability required for CW will be possible, I doubt that the stability for your DSP techiques will be.

pescatore_jt%ncsd.dnet@GTE.COM posted something headed:

>>Subject: Low SNR Code Debate: K5ZC is in the numerator

I think you meant to say denominator? - kids these days just don't
know any mathematics! - or perhaps it was meant as a compliment.

He also says:

>>I think it is a lot more fun talking to a 16 year old who is at
>>a high school station than to a 85 year old at a retirement home.

This is an unfeeling sort of thing to say. When you reach 85, and
the only fun left to you is your ham rig, you might enjoy QSOs with
middle-aged gents. There are a lot of old farts on the air, for sure,
but there are also some middle-aged ones and some objectionable young
hams as well. I've heard guys in their mid-70s who can still send
CW (you should pardon the expression) at respectable (30+ wpm) speeds,
and I'd rather have a QSO with one of them than with some kid who can
only send at 10 wpm.

While I understand the concern about the lack of young blood, you have
to remember that hamming is one of those hobbies that you can continue
well beyond retirement, yeah, even into a retirement home, unlike water-
skiing, drag racing, pole-vaulting and so on. I expect there is even
an increase in most people's hamming when they reach retirement age.

I should admit that this comes from someone who resigned from the ex-G
club on the grounds of not being ill enough to be a typical member,
thereby provoking violent mail from one of the elderly patrons...

>should be trying to attract. It HAS tried to attract me multiple times and
>it's come close. But it's also successfully convinced me to spend my time
>and money and energy elsewhere because of all the hassles and the problems
>and the attitudes.

I read your message with pain and sadness. I don't know any way to tell
you that your experience at the hands of a few selfish individuals is
not representative of the ham radio I know and love, and that has given
me as much as, if not more than, I have put into it, since your
experience obviously differs from mine.

I have great respect for your level-headedness, and your contributions
to Usenet are legendary (a few malcontents notwithstanding). I think
you'd be a valuable asset to ham radio, and would get a great deal of
enjoyment out of it.

My comments aren't directed at the minority of potential hams that have
been turned off by the code requirement in your class, but the much
larger contingent to be heard, for example, between 27.405 and 28 MHz
bragging about how they could pass the theory test with one hand tied
behind their backs, but how they won't bother to learn the code. I have
no use for them.

Please don't assume that I feel the same way about you that I do about
them.

That's a cop-out, Jay. It also assumes that the FCC is unwilling to listen to public comment. While that has been unfortunately true on some occasions (read: 220-222 MHz), throwing your hands up in the air and saying, "they won't listen anyway" isn't the answer. Of course, now when the FCC comes up with a no-code license you can tell everybody, "I told you so."

As of a year or so ago they were in existance, located in the Southwest.
(Arizona, I think.) The fellow running the place is, I believe, one
of the original principals. (I'm not at work and don't have the name
in the internal memory bank.)

The reason I know this is that they upgraded a Milspec 1080C radio that
was donated to ARRL, putting in the latest microprocessor control.
Apparently they are selling these radios to automated RTTY (SITOR?)
stations. Signal One has software that allows remote control of these
stations using IBM PCs.

468. 'G' Licenses, no-code & Project YEAR.

Newsgroup: rec.ham-radio
Date: 1990-08-14 09:44:34 UTC
From: hugh_davies.WGC1RX@XEROX.COM
Message-ID: <900814-102511-1821@Xerox>
Source record: 9204

Since some comments have been made about licensing in 'G', here is some grounding for you to argue about;

There are two classes of Amateur Radio license in 'G' land, called Class 'A' & Class 'B'. The only difference between them is the Morse test. They both sit the same exam (a 2 parter, multi-choice, takes about 3 hours total). If you pass both parts of the exam, you can apply for a 'B' license which gives you full privileges from 30MHz up, including the ability to use Morse, if you so wish, but you must ID on phone (because "your code is not guaranteed to be readable" - whatever that means.) If you wish HF privileges, you sit a 12wpm Morse test, both send and receive, text and figures. Effectively you must have 100% copy in receive, no uncorrected errors in sending (and a limited number of corrected errors!). If you pass, you get an 'A' license which allows you to operate from 30MHz down as well as up. If you already have a 'B' license, you get a new callsign. 'A' calls are; G0, 2, 3, 4 + 3 letters, G6+2 letters (obsolete), 'B' calls are G1, 5, 6, 7, 8+3 letters.

Now for a contentious statement. Since the introduction of the no-code ('B') license, approximately 80-90% of 'A' license holders start with a 'B' license, then move on to learn the code in order to get HF privileges. That says to me that no-code *is* a good way to get people into the hobby.

But - The British ham population is ageing, as in the USA. *So*, the code isn't the only reason why people don't enter. And I think the reason they don't enter is because amateur radio is essentially an invisible hobby. Nobody knows we exist. Someone said it was "a bunch of nerds tinkering in their dungeons", and he was right. So the RSGB has instituted Project YEAR (Youth into Electronics via Amateur Radio - and yes, it is a crap acronym.) This project has the support of many organisations such as the Department Of Trade and Industry, the BBC, the RSGB, the Department of Education, some of the trade organisations, and so on. It's serious enough that the DTI have donated a cash prize for Young Amateur of the Year, plus various other people have donated time, effort and money. It's based on mutual self-interest; The establishment realises that we are desperately short of electronics engineers and the amateurs realise that we need more amateurs. By doing this, the establishment has shown that they think Amateur Radio is more than just a hobby - it's a way of getting people into the electronics industry (where, by the way, Morse Code is about as relevant as a bicycle is to a fish.)

But, we're still not hitting the target audience. Young people. The RSGB are producing a video, a magazine aimed at the younger audience, and they are working on a Novice License with an easier exam than the 'A' and 'B' test, plus a 5 wpm Morse (sigh) test. On a personal level, our club called

all the local schools, Youth Groups and Scout and Guide groups, and invited them to a series of meetings. About 60 kids turned up. (Incidentally, although we wrote to all the local high schools, not one bothered to reply.) One month we talked about "What was Amateur Radio", another month I gave a talk about and demonstration of packet radio, and another member gave a demo of satellite technology. Frankly, we had to beat the kids off with a stick. They were *fascinated*. We got dozens of enquiries, and several new members out of it.

So, whilst the code *IS* a barrier to new entries, removing this barrier isn't necessarily going to bring in floods of new people. You've got to get up off your fat ass and *do* something about it. That's the difficult bit - blowing hot air on the network doesn't count doodley-squat.

Sorry I waffled on so long.

73, Hugh Davies, G0CNR
(Yes - An 'A' licensee. And yes, I came in via no-code, I was G1BUE then.)

>As I was made to understand, DOVE also carries a voice
transponder. If this is so, is the voice transponder active? What

John, I have been copying the telemetry regularly, and several days ago
a text bulletin was included saying that the voice stuff was pretty close
at hand, and that dove might be off for a while during uploading of the
software.

If you'd like to see some of the telemetry, email me personally, and I'll
send you 20-30k of data.

0.93	Spain	Norway	0.045	33
0.49	Belgium	Argentina	0.035	30
0.32	Italy	Australia	0.006	5
0.25	France	Canada	0.006	6

Table 1 - International Amateur Data

* Since Japanese operator licenses never expire, this number
is a count of all licenses issued, not a count of
currently-active amateurs. For example the 1990
International Call Book lists 34,344 Japanese amateurs, a
far cry from the claimed "one million". About 80% are no-
code licensees who can operate all modes, 10 W, all bands
except 10 and 14 MHz. Japanese amateurs and this factor is
reflected in these computations.

>some occasions (read: 220-222 MHz), throwing your hands up in the air
>and saying, "they won't listen anyway" isn't the answer. Of course,
>now when the FCC comes up with a no-code license you can tell everybody,
>"I told you so."

I gave long thought to whether or not I was going to file comments before making my decision not to. The FCC has indeed lately been unwilling to listen to public comments that oppose a particular course of action - witness the 220 grab. I have no reason to believe that any individual's comments - no matter what they said or how well they were written (and, from Phil's description, I could most likely do better than most of the comments opposing a no-code license) - would materially affect the Commission's opinion. I decided not to invest mountains of effort in beating my head against a wall.

That does, of course, lead me to wonder what the hell I've been doing here for the past year or so...between pointing out the realities oof frequency coordination, and being one of a few pointing out the myriad problems associated with lowering the standards of admission to ham radio, I suspect that I don't get listened to very much anyway. *sigh*

Maybe I'll quit beating my head against this particular wall, too.

>Here is a question I've been pondering for a long time:

>What ever happened to R L Drake company??

>Greg, KA7CJA

Drake is still in business, but they no longer manufacture ham equipment. I believe that they mostly build satellite (TVRO) receivers and related hardware now. I know that a couple of years ago they were still offering repair service on the ham gear because a friend of mine sent them an R-4B to be overhauled and aligned. They charged some set fee (eg $100) and did a good quick job. I don't know if this service is still being offered or not. Drake gear is still a pretty good buy from what I've seen.

Message-ID: <9008141257.AA12559@ucsd.edu>
Source record: 9187

COUNTY HUNTERS:

I hope this type of posting is OK and within the ethics of county hunting.
I live in the Upper Penninsula of Michigan (da YooPee) and I have discovered
county hunting. What fun.

I have found few folks up here intersted in county hunting or activly providing
these counties. I will be more than happy to make schedules for most of the
counties in the U.P. 20 and 40 meters are best for me, but I will try anything
on HF.
The central counties of Marquette, Delta, Alger, Schoolcraft, and Dickenson are
real easy to get to (I live in Marquette), the others need a little more
planning. Evenings and weekends of course are the best.

Please send me e-mail with your requests, no need to clutter the net with
important ham stuff and detract from the constant drivel of no-code and whether
or not you can use your radio on an airplane.

477. What have you done to help the hobby?

Newsgroup: rec.ham-radio
Date: 1990-08-14 13:10:52 UTC
From: magid@select.enet.dec.com
Message-ID: <14568@shlump.nac.dec.com>
Source record: 9189

With all the debate over code .vs. no-code and all of the hassles here regarding "our other problems" I must ask the following questions of all who participate in this conference.

What have you done for the hobby lately ?

How many of you have encouraged others to join in the fun, AND have help them by way of your experiences ?

In addition, how many of your responses to 90-55 where as thorough as the one written by Phil Karn? (whether or not you agree or disagree with what Phil had to say)

It is true that incentive licensing has been a failure, but what has to be done to correct it. The FCC is downsizing its staff and from a recent visit/discussion with them it looks like without any valid input we may see the following as a result of 90-55.

Communicator Class ----- ALL Privs above 30Mhz NO CODE
Novice Class Current Privs CODE 5 WPM
NEW CLASS ALL Privs CODE 5 WPM

ALL Tech,General, Advanced and Extra would become this NEW CLASS

The above only because of (in the opinion of the FCC) it would reduce the burden on their system. The person I spoke to said that the only changes that would be acceptable to them are ones that would save them money and people. Yes they care, but are really budget constrained.

We can discuss and argue all of these points as we have been doing or we can do something to help everyone enjoy the hobby.

>We are designing a repeater controller interface circuit with both
>analog and logic portions (unique, eh?). ....
>
>Now we have two grounds internal to our circuit board.
>What do we do with them?
>

I hope you also have 2 separate supply lines else all your efforts are in vain. Ideally you should have 2 power supplies to feed your repeater. One designated "dirty" for the logic and switching circuits, the other "clean" for the analog circuits. This will remove any mutual coupling from having switching spikes in the same lines as the analog power. The two grounds would then be taken to an earth bonding point but as no current will flow in these lines, noise will not be induced.

However, I am a realist and the practical solution is to common the ground rails at the PSU and connect the analog power rail to the PSU via a filter (RC for low current LC for high current).

Hope this helps.

>essential!
...
> It is a very useful
>skill (indeed - here it is ESSENTIAL), and reasonable proficiency (~13
>wpm) should be absolutely required.

If CW is that essential, why don't you let people discover that for
themselves?
In the 8 years that I have my license, I felt absolutely no need for
CW - while building a SSB transceiver (just for the fun of it),
or while building small repeater hand-helds, smaller than commercial
ones available at that time (also, just for the fun of it), or for my
tons of other projects.

Once more, the exams are built in such a way that people can operate
(build, modify, repair) RF gear safely (thus know the harmfulness of
spurious frequencies, high power and the like), and let the rest
of skills develop by practice.

If someone wants to develop skills to build RF gear by himself (the
exams are NOT SUFFICIENT for that - some practice is required), that's
fine, he knows how to do that without disturbing neighbour's television.

If someone wants to work via satelites, that's fine. If he needs to learn
about orbits to know where to aim his antenna at, let him find out!

If someone wants to operate RTTY, that's fine. If he needs to find out
you usually cannot run SSB finals on max power continiously, let him
sniff and find out. If he needs to learn how to type, let him find out.
Speedy typing is not required on the exams (however, if one looks at
some typing done on packet, maybe typing may be in the exams? JUST KIDDING :-)

If someone wants to develop skills to receive very weak, distant signals,
that's fine. If he needs to learn some encoding technique that may be
more efficient, let him find out, don't force it on the exams!

After all, the Amateur Service is a service of self-education, isn't it?
Learning by doing it, it's much more instructive, and certainly much more fun!

Glad you like IT.

InstantTrack is not public domain. It is however available, for a small donation, from AMSAT. AMSAT is a non-profit, and mostly volunteer, organization that builds and launches amateur radio satellites.

Version 0.85 of InstantTrack is not a released version. It was a beta-test only version distributed to a limited number of people over a year ago. It should not be distributed, as the README file that comes with it clearly explains.

As for information: I suggest you call AMSAT, at 301-589-6062, and become a member. AMSAT's publications are one of the best sources of information about amateur radio related satellites. Purchase a copy of the released version of InstantTrack while you're on the phone. The documentation that comes with IT contains information on many more sources of info.

>> A LICENSE in the first place.

>It is OBVIOUSLY RELEVANT for any license that grants privelege to
>operate in the weak signal portion of the band. Hence, my comments to
>the FCC regarding their ill advised no-code license, in which I urge

Somewhere along the way, my comment regarding typing skills and RTTY was deleted - so I'll ask the same question in a different way. Of all the possible operating modes, CW is the *ONLY* one in which applicants are expected to demonstrate proficiency. Why? You'd have me believe that it's to guarantee that those operating in the "weak signal portion of the band" are competent with a key, but I see no reason to believe this - nor do I hear any reasons on the air. Getting a ham license presently means that a person, at least at one time, could copy code reasonably well and send likewise. It by no means guarantees that, once on the air, the licensee will continue to do so, and it by no means guarantees that the licensee will use his privileges in ANY mode in a competent and courteous manner. So why do we single out CW proficiency as the one important factor to test in a new applicant? I certainly can't justify the practice simply on your desire to cut down on the number of (in your opinion) lids in your favorite slice of the spectrum, especially as there's no reason to believe that the current licensing structure achieves this goal. (If a person really wants to play in the "weak signal/CW" zone, don't you think that they're going to try to operate in a proper manner anyway? And the ones who DON'T care - do you really think that the code test will stop 'em? Is CW some magic test for operators who are "pure and righteous?")

I'll repeat my original example. Say I'm a RTTY fanatic, and I'm fed up with hunt-and-peck artists clogging up the airwaves, leaving no room for me and my buddies to exchange 60 WPM QSOs. Now, using your reasoning, why shouldn't I ask the FCC to require a typing proficiency test of all applicants? After all, they'll have the privileges to operate RIGHT ALONGSIDE OF ME!!! HORRORS!

(I could be nastier and point out that I could grab a $99.95 computer and a decent CW program, and get right into the "weak signal" realm with the best of you - and not even know a lick of CW myself! Why not? Now, if you want to argue against machines taking over the time-honored CW reception chores, then I'll come right back and suggest that we should all be required to copy RTTY or SSTV *by EAR*. Hey, why not?)

In as far as 10-codes go, I too have found MANY variations. Just in my commute, I pass through 5 or 6 cities and 2 counties. Each may have its own different set of codes.

In searching for answers in the jumble of codes, I have found an EXCELLENT reference (especially for metropolitan areas). The book 'MONITOR AMERICA' has proven to be a FIRST CLASS aid in targeting frequencies of local/state agencies AND many PRIVATE agencies and also provides codes used in many areas. The book covers all states in general and most metro areas.

Monitor America was published in a 85-86 edition and was never updated due to the time and money it took to publish the book and the relatively low volume of units sold. Even with its age, I don't know what I would do without it! It is published by SMB Publishing and is available at almost every store that deals in scanners.

As for California, many departments use Penal Codes and Vehicle codes for dispatch. A Vehicle Code book is avaiable from the Department of Motor Vehicles for $3.00 (a good buy in today's world). Also included in the DMV Vehicle Code book are the Penal Codes!

If anyone has any questions about codes used in the Monterey or SF Bay Areas, please feel free to mail me.

>code keys, nor DSP equipment (for receiving very weak signals at very
>low baud rates).

Again, why? Commercial DSP equipment exists, and more is on the way. Also, why does this have to be a youngster? Since presumably we'd like to get more tech folks into ham radio (the ones who have the loudest -- and fairest -- case against CW). Let's consider the cost in real dollars of bringing them up to 20wpm (nowhere near the bit rate available via dsp, but I'll go easy on you).

>With your choice, the CW contact is not possible, and the challange is
>not fair.

Your choice requires time (and therefore money) which results in a skill that is less efficient. Who's being unfair here?

This is a periodical (monthly) posting to announce the availability of CAPITAL, a Civil Air Patrol electronic newsletter published on a more or less weekly basis.

The Civil Air Patrol is an auxiliary of the United States Air Force, that provides emergency services (including search and rescue missions for downed aircraft), aerospace education, and a cadet program. As part of its operations, the Civil Air Patrol operates a radio communications network.

If you are interested in receiving this newsletter, please send your name and InterNet address to aviator@athena.mit.edu. If you are a current CAP member, please include grade, squadron, charter number, and callsign. Submissions will also be accepted at this address, along with back issues requests.

Please feel free to distribute this article further.

Well, let's see here. I had just turned 23 when I saw W3IWI and N4HY demo some of their DSP stuff at an AMSAT get-together. All I would have had to do was 1) obtain one of the TI DSP boards and plug it into a PC (something I've been doing since I was about 15), and 2) Copy some floppies (again, something I've been capable of since the days of the S100 beast).

The best part is that I could get college credit for putting this sort of thing together, something that CW can't buy. Not to mention a superior signal interception system, with far greater sensitivity, speed, and spectrum efficiency.

>This body of knowledge is
>considerable, as demonstrated by the fact that most electrical
>engineers with a bachelor's degree are probably not comfortable with it.

A gross overgeneralization. Stanford recently converted its intro-to-DSP course to an undergraduate junior level course. Marquette also offerred an undergrad course, and it was always packed. Since both of these courses are optional, their popularity demonstrates that DSP not only simple, but considered to be very important, even by "youngsters".

Sorry, but CW is not cost effective.

>affect the Commission's opinion. I decided not to invest mountains of
>effort in beating my head against a wall.

On the other hand, there was a note posted on the net today saying that because of feedback the FCC is considering changing the Communicator class to be anything greater than 30MHz rather than the original proposal. So if they're not listening, they're independently coming up with some interesting ideas.

If you don't file your comments, Jay, they can't listen even if they want to. You've made the decision for them. If you file and they pay no attention, there's not a lot you can do about it, but failing to file cedes the defeat before you even started the battle. Don't give them any excuse to ignore you.

Phil Howard, still hammering on the code requirement, says that there are other reasons why people don't get into ham radio. He says that the CW requirement is the first big obstacle to be overcome. OK, let's identify some of the other big obstacles. What are they? Technical exams? Rules? Operating practices? Cost of equipment?

I stated once before, and I think it bears repeating: There are bigger reasons for yound people not getting into the hobby than CW. Today there are *many, many* more things for them to be interested in than there were, say, 30 years ago. There are loads of *affordable* options for entertaining hobbies, not the least of which is the TV set. Couple that with the "Nintendo" games. Add computer hobbying. For those who just want to chat, there's CB radio which has no licensing or entry requirements at all! Taken together (and there are certainly more pursuits), these account in large measure for the waning interest as *radio* as a hobby.

I agree with Phil that all the advertising in the world won't make many people buy something they don't want (actually, none will). But it is also true that if people really want something, they will work to get it.

I believe that if amateur radio has a problem with piqueing the interest of youngsters today, it has little to do with the licensing requirements. It has a lot to do with the options they have.

So, Phil, how about your list of things you believe to be big obstacles to entry into the hobby? Something other than CW for a change.

Source record: 9180

> ...maintain a charge on a gel-cell from an automotive electrical system.
> ...hook up a low-voltage-drop voltage regulator IC in constant-current
> mode...

There's a simpler way that works for me. Whatever your personal
standard 12V power connector system is (*), build a unit like this:

```
hot source
______________| |_______________
sink--------------------------------sink
ground
```

Plug your car (source) into one sink, your gel cell (other source) into
the other sink, and a portable light (sink) into the source. Use an
appropriate light. For instance, WalMart sells a magnetic stick-on 12V
light for under $3 that's about the right resistance.

The light bulb is a variable resistor that limits maximum current flow a
to safe level. At low current flow it's a low value resistor. The
difference in voltage between the auto (when running!) and the gel cell
is enough to push charging current into the gel cell, just like the car
battery. Disconnect when the car is off, just in case the gel cell is
higher voltage.

The light bulb is also a nice visual indicator of current flow.

(*) Every ham should have a personal standard 12V connector system. For
years I built various doodads without thinking of consistency. When
I got licensed my ham friends turned me on to the idea. I put some
thought into it and decided to be compatible with one of them. We
use 6-pin 0.093" Molex connectors, available from Radio Shack and
other places. Not cheap, about $1.40 each, but they provide added
pins for audio, etc. if needed.

Having standard, keyed connectors means you can't accidentally
mis-plug anything -- except through a weird cable like the one
above. Here are examples of my 12V sources and sinks:

sources:
auto female cigarette lighters
auto direct-wired fused connectors
gel cell
12v plug-in supply

sinks:
HT
10m rig

VCR record unit (also has a built in gel-cell charger)
portable lights
auto vacuum
cassette player

499. VAX VMS `decompress' Program?, DECUS files?, Amiga Programs?

Newsgroup: rec.ham-radio
Date: 1990-08-14 21:51:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9008142049.AA10839@ucsd.edu>
Source record: 9219

I'd like to pose 3 questions to my fellow INFO-HAMS readers:

1.) Does anyone out there have a VAX VMS compatible program that
will de-compress files, such as the archives of "INFO-HAMS"?

Brian Kantor has told me that the archives use a standard UNIX
`compress' routine, and I'm hoping that it's a common enough
protocol so that there'll be something similar in the `VMS World'.

2.) Are there some `VAX people' on the net who may know whether
we have access to any DECUS (DEC Equip. User Group) files
via InterNet? Now that I'm having some luck at using `ftp',
it's getting a bit depressing to find that most of the files,
that are available while using the "anonymous" UserID, are
either UNIX or MSDOS-based routines. Surely (!) there MUST
be some DEC VMS users `out there' (?).

3.) I've run across a few places that have Amiga Computer programs,
and am wondering where there might be others? Suggestions
would be appreciated.

Thanks,

Paul Nix (WB5AGF) InterNet: nix%muppet.decnet@consrt.rok.com

```
================================================================================
```

9600 BAUD (BPS) FAX TEST RESULTS

Conducted between WB8WKA (NOS TCP/IP) and WA8OOH (MSYS v1.08)

(Please reference my earlier posting "9600 baud FAX MODEM" for a more
detailed description of the circuit.)

Between 7/25/90 and 8/6/90, the amateur radio stations of WB8WKA and WA8OOH
tested a "V.29 FAX modem" chip, the YAMAHA 7109, between there respective
packet radio stations. Distances involved where about 7-8 miles over urban
terrain. Results where quite positive with respect to the performance of the
radio link. Equipment and power levels used at each station follow:

RADIO EQUIPMENT:

WA8OOH WB8WKA
Livonia MI Farmington MI

ICOM28A (5 watts) KENWOOD 7950+amp (160watts)
MFJ 1270 TNC GLB TNC2A
MSYS V1.08 on IBM AT NOS on IBM AT

Additional radios where also tested. At WA8OOH, good results where also
obtained with a 215 Kenwood HT at 200-300 milliwatts. A Kenwood 7730 was
also tested with very poor results. Past experience with this radio and the
failure of any PL to function correctly on it may need further investigation.

At WB8WKA, tests where also run at power levels less then 160 watts with
excellent results, but due to the sharing of the radio with one of the
Detroit/Windsor TCP/IP lan's, running lower power full time was not practical.
In addition, a ICOM 2AT was tested at 100mw with excellent results.

Signal strengths at both stations where full scale, even at lower power levels. Antennas used at WB8WKA consisted of a AEA ISOPOLE at 50' while at WA8OOH we had a Hustler G7 at 20 feet. All tests where conducted on 2 meters.

THROUGHPUT:

As was to be expected, throughput took a dramatic step up. About one megabyte of files where moved via tcp/ip, with the throughput hovering around 100 bytes/sec. While this is certainly nowhere near "9600 baud", it was a significant jump over earlier tcp/ip testing at 1200 baud. It is thought that there may be some incompatibilities between msys tcp/ip and net/nos. Tests will be run latter this week between two msys stations to see if this figure can be improved upon.

In AX.25 operations, ("user" to bbs) operation was simply put, a dream. By using the "XF" command in msys, full packets where transferred. Setting "X22" allowed a full screen to be transferred at a time. Throughput was about 1 page a second, which worked out to be about 6000-8000 bits per second. From a "user" perspective (I was the user in this case) it made operating the bbs much more enjoyable. As many of our LAN's in the southeastern MI area our crowded, the additional speed did not go to waste.

If I may quote WA4DSY, "Oh where oh where is my HIGH SPEED DIGITAL"? What this means of course, is that we where not able to fully exercise the modems due to MSYS and/or our TNC's not being able to go beyond 9600 baud. The tnc's where modified for 19200 baud operations but we experienced dropped characters. In any type of KISS operation, it is important for maximum throughput, that your DATA link (async link) be at least twice as fast as your radio link. As we where not able to achieve this, then our hope is that much faster throughput can be obtained.

GENERAL IMPRESSIONS:

Audio setup is much more critical. Tones will tend to sound undermodulated. In addition to audio setup, a "keyup delay" circuit must be setup as well. This is due to the fact that these modems send a "training sequence" upon keyup. This must be held off until the radio is fully keyed up. (generally 100-200ms) Once these parameters are set up, things seem to be fairly stable and the modems can be relied upon in day to day operations.

IMPROVEMENTS:

A easier method for tuneup needs to be developed. If possible, mounting inside the TNC would also help. Current carrier detect in YAMAHA chip is useless. Have been unable to get state machine DCD to work on this chip but it is what is needed. Current layout use's +-5V, this needs to go. Must run on only +5V. Also will add programming header and mode select DIP switch.

Existing PC (a carbon copy of the PRUG circuit board) needs to be improved. Quite a bit of digital noise exists on this chip and a re-layout of the PC board would help greatly.

THOUGHTS:

While my original idea of the use of this modem was "networking", more and more I am beginning to feel this will be the next step for the end user. In many applications such as the DX cluster, TCP/IP and bbs operation, increase of speed on the user LAN is becoming more important. While this modem should be a fine performer on our "network backbones", the ease of implementation and the fact that IT CAN BE USED ON EXISTING RADIOS UNMODIFIED should be quite appealing for the amateur that wishes to increase LAN throughput.

WHATS NEXT:

In the next week or two, I need to re-layout out the circuit board to include the improvements I have found. In addition, I DESPERATELY need schematics for TNC's. I have schematics so far for the TNC1, TNC2, PK232 and DRSI. If you have schematics for any *other* tnc, PLEASE send me a copy to the address below:

Jeff King WB8WKA
22816 Maple Ave
Farmington, MI 48336.

Also, if you would like copies of the article describing this chip, please send a SASE to me at the above address.

BETA TEST:

So far, about 16 people have expressed interest in participating in a beta test of this modem. What this basically means, is that we will all get together and make a group buy of parts and such to reduce our costs. In addition of course to the sharing of information that a beta test implies. With a professionally done PC board and all parts I expect costs to be on the order of 60-70 dollars. This is of course assuming we can get a decent discount of the YM7109 (fax chip) as it alone goes for $55!!

There's been lots of MAC flights to listen to on 11.176 MHz.
That frequency, along with 6.738 and 13.214 MHz are used by the US
air base at Insulic, Turkey.

Why do Germany and France not allow the sale of radios which get these
frequencies? Also, is it really illegal to sell a ordinary FM radio
(88-108MHz) in France?

511. W3XO's Comments on 90-55

Newsgroup: rec.ham-radio
Date: 1990-08-15 02:52:40 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9008150252.AA03439@cmr.ncsl.nist.gov>
Source record: 9202

I have been asked by W3XO to post his 90-55 comments to the net; here goes:-

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

PR Docket No. 90-55

In the Matter of
Amendment of Part 97 of the)
Commission's Rules Concerning)
the Establishment of a Code-free)
Class of Amateur Radio License)

Submitted by
William A. Tynan W3XO
HCR 5 Box 574-336
Kerrville, TX

Summary

I support the basic concept of creating a code-free class of Amateur Radio license provided that it is established with goals of:

1. Encouraging responsible and knowledgeable people, particularly young people, to enter Amateur Radio.

2. Leading to an increase in the utilization of the higher frequency Amateur bands (220 MHz and above).

3. Not increasing the difficulty of entering Amateur Radio for those who might not be as knowledgeable and technically qualified as perspective code-free license candidates might be.

4. Not disrupting current valuable amateur activities.

Background and Qualifications

I have been a licensed amateur since 1945, with the original call, W3KMV being issued about six months later. I began with a Class B License and obtained a Class A in mid-1946. In the mid-1970s I obtained an Extra Class License and requested, and received, the present call in 1976. I have operated all Amateur bands from 160 meters to 70cm with the exception of 30 and 17 meters. My principal interest has been in the VHF and UHF range and I am especially active on 6 meters using SSB and CW. I have contacted a total of 101 countries on that band. I have also been active on the 2 meter band, using all modes; CW, SSB, AM, FM and packet. Before leaving Maryland at the end of 1988, I had contacted

37 U.S. states on the 2 meter band. Since 1975, I have been the conductor of QST column The World Above 50 MHz which is devoted to reporting events in the VHF, UHF and microwave Amateur bands. I was a founding member of the Radio Amateur Satellite Corporation (AMSAT) and have served twice on its Board of Directors. I am currently an AMSAT Director, as well as its Vice President for Manned Space Programs. In that capacity, I have authored three proposals, which were submitted to NASA Headquarters jointly by AMSAT, and ARRL. These led to operation from the Shuttle by licensed Radio Amateurs. In my professional life, I was employed by the Johns Hopkins Applied Physics Laboratory Laurel, MD from 1951 until retiring in March 1988. There, I attained the position of Senior Engineer and worked on a number of U.S. Navy weapons programs. I graduated in 1950 from Rensselaer Polytechnic Institute Troy, NY with a degree in Management and Electrical Engineering.

I believe that my many years as an amateur, my current position as conductor of The World Above 50MHz and my association with AMSAT gives me a particular insight into the ramifications of establishing a code-free license, influenced especially by the privileges the Commission sees fit to grant its holders.

I cite my background and affiliations only to establish my credentials to comment on this NPRM. The comments contained herein are not to be taken as representing the views of any of the organizations with which I am, or have been, affiliated. They are strictly my own.

The AMSAT Board voted unanimously to support a code-free license, some months before the ARRL established its committee to study the mater - and ultimately submitted a Petition for Rulemaking. Our reasons for suggesting the establishment of such a license were based on meeting two principal objectives.

1. Increase the amateur population on the higher bands, especially the bands above 1 GHz.

It was felt that this is particularly important in the light of the approaching WARC; in which it is believed that great pressure, particularly from European countries, will be exerted to reallocate parts, or all, of these bands to other services. Since continued amateur allocations in this part of the spectrum are considered vital to the future of the Amateur Space Program, the AMSAT Board members favored, and still favor, any steps that can be taken to promote amateur occupancy of these bands.

2. Bring more talented technically minded people into Amateur Radio. The AMSAT Board members feel that there are many people, especially young people, who are intrigued by today's technology such as computers and space, but are deterred from becoming licensed amateurs by the need to learn the Morse Code. A majority of the Board believes that the problem is not with these people's inability to learn the code, but rather, their conviction that it irrelevant to today's communications techniques. (While I do not subscribe to the view that Morse Code is

irrelevant, I do understand how some people can reach this conclusion.)

The decision of the AMSAT Board was informally conveyed to various ARRL officials, and may have contributed to the League's establishing a committee to study matter and later submit a Petition for Rulemaking. The Tucson Area Packet Radio (TAPR) organization's Board of Directors reached a similar conclusion about the same time. Its action was also made known to League officials. In this way, although AMSAT did not submit its own Petition for Rulemaking, I feel that the AMSAT and TAPR Boards' decisions contributed significantly to the process which led to the League's Petition and the Commission's subsequent NPRM.

Comments

I have had, and continue to have, reservations as to the need and desirability of establishing a code-free Amateur license. I have always felt that the accomplishment of learning the Code represents a commitment on the part of perspective licensees. I believe that it demonstrates that the person is really interested in Amateur Radio as a hobby, rather than merely a means of getting on the air to satisfy some specific need for communication. However, since I supported the AMSAT Board in its un resolution on the matter, I do not feel that it would be proper to take a different stand in these proceedings. I, therefore, support the establishment of a code-free license provided that it fosters the two objectives cited by the AMSAT Board. I will address my specific recommendations for accomplishing this in the following paragraphs. I have some additional concerns which are raised by the Commission's release and will also address these.

As stated above, I support the concept of a code-free license provided it is aimed at attracting people who are seriously interested in Amateur Radio as a technical hobby, not merely the desire to "talk on the radio", or for the purpose of establishing some specific communication link, such as with a spouse. For those for whom such an application is their principal aim, the 27 MHz band is available. To implement the objective of recruiting people really interested in radio, I believe that the written exam should be designed to require real learning of a broad range of radio and electronic theory, not merely memorizing the answers to a few questions. It may be that the 60 question test proposed by the Commission is consistent with this aim. However, I do contend that some questions relating to digital theory should be included as the people interested in that aspect of technology are among those we should be attracting to Amateur Radio through the code-free license. Nevertheless, I don't consider myself an expert on designing tests and will leave the details to those who are.

I support the Commission's proposal to limit the privileges of the new proposed license to the 220 MHz band and above. (The Commission refers to it as 222 MHz.) I believe that this is consistent with the objective of encouraging an increase in the occupancy of the higher bands. I might even limit code-free licensees to 1240 MHz and above, but I understand the need to not relegate them to a "ghetto"; but, rather,

make the license something that can be useful immediately. In most populated areas, there is significant activity on the 1-1/4 meter and 70 cm bands. The granting of Novice privileges on the 1-1/4 meter band has materially increased activity there and many 1-1/4 meter repeaters are now linked to 2 meter repeaters. This permits Novices and, ultimately, code-free licensees to communicate with amateurs using such cross-linked repeaters. I am aware that some individuals and organizations favor permitting code-free licensee use of all VHF and UHF bands (50 MHz and above). I believe that this would be counter-productive to the objective of increasing occupancy of the higher bands. Futhermore, I feel that it could also have a severe detrimental impact on current operations on the 6 and 2 meter bands. I point out that, in its NPRM, the Commission states that one of its objectives is to "avoid any negative effect on current licensee...". If the Commission sees fit to grant code-free licensees access to 6 and/or 2 meters, the "effect", so produced, can be minimized by instituting other rule changes, which I will discuss. Particularly in the case of 2 meters in the large metropolitan areas, crowding and inter-mode friction is becoming increasingly serious. Most people, in and out of Amateur Radio, seem to believe that amateurs use VHF almost exclusively for wide band modes such as FM voice, packet radio and amateur TV. They fail to consider the important minority which employs narrow band transmission modes such as SSB and CW to great advantage on these bands. It is almost solely these people who are learning to take advantage of the more obscure types of radio propagation, such as tropo scatter, ionosphere scatter, meteor trail reflections, moonbounce and amateur satellites. Signals from distant stations, propagated by such modes of propagation, are not even noticed by those using FM and other wide band transmission modes. It is the people who utilize narrow band/weak signal techniques who are constantly designing and building more effective antennas to attempt to obtain that last fraction of a dB of gain to take advantage of such, usually weak signal propagation. The same goes for RF power amplifiers and low noise receiver preamplifiers. Not surprisingly, the amateurs interested in weak signal narrow band VHF/UHF and microwave work, do much more building than does the average amateur. The fact that such operators are not in the majority should not be used to dismiss them as unimportant and insignificant. But that is what is currently happening, especially on 2 meters around the large cities. The increasing use of FM for both voice and packet radio will soon make weak signal work all but impossible for many of our active SSB/CW operators. Current FCC rules permit wide band modes, based on FM, to be used anywhere above 50 MHz, with the exception of the segments 50.0 to 50.1 and 144.0 to 144.1 which are reserved for A1 (CW). As beneficial as these CW preserves are, they do nothing to prevent people from operating FM anywhere else in the VHF spectrum. And many do - especially on 2 meters. In recent years, numerous local voice nets and many packet services have cropped up between 144.3 and 144.5. Some have even been "coordinated" by local and regional frequency coordinators. This is despite the fact that the ARRL Band Plan and many years of custom have defined the 144.0 to 144.5 MHz and 50.0 to 50.5 segments as being for narrow band transmission

modes. AMSAT announced in the early 1980s its intention to use the 144.3 to 144.5 segment for future amateur satellites. It did so, feeling that such use should be generally compatible with the use being made of those frequencies by weak signal terrestrial operators. This intended satellite use was subsequently reflected in the ARRL Band Plan. With the launch of OSCAR-13, that use was begun - only to experience serious interference from FM operators; and howls of protest to the effect that "those space people are trying to grab our frequencies".

I firmly believe that, if code-free licensees are given access to 6 and 2 meters, and no other new rules are instituted; the pressure on weak signal work from FM operations will increase to the point that weak signal work on 2 meters will not be possible throughout much of the country. If that is allowed to happen, Amateur Radio will lose some of its most dedicated and valuable practitioners. Such an eventuality can hardly be construed as meeting the Commission's third objective of " avoid[ing] any negative effect on existing licensees". While FM inroads are not as pervasive on 6 meters as they are on 2 meters, indications of trouble ahead are already evident there also. For example; an influential 6 meter group in southern California has, for several years, been actively promoting the use of 50.3 MHz as an FM channel. To prevent further pressure on weak signal/narrow band operators, I strongly oppose the opening of 6 and 2 meters to code-free licensees; unless the Commission is willing to also adopt rules reserving 144.1 to 144.5, 50.1 to 50.5 and the satellite segment, 145.8 to 146.0 MHz for narrow band modes consistent with AM, SSB and CW. An exception must be placed on 145.8 to 145.0 to permit FM for orbiting spacecraft. (I have included AM, even though there is little current AM activity on these bands.) Furthermore, I urge that such a rule be adopted even without opening up these bands to code-free licensees.

If the Commission decides that code-free licensees should be permitted on 6 and 2 meters, the current band users can be expected to welcome the new operators, provided they employ the same transmission modes as are now customary. However, since I feel that, no mater what kind of exam the Commission develops, a majority of code-free licensees will use FM modes, mostly because that's what most amateurs, and non-amateurs, think VHF is for. In my opinion, the surest way to make the new licensees feel unwelcome is for them, possibly inadvertently, to begin by using FM on portions of the bands customarily employed for weak signal work. If code-free licensees are given access to 6 and 2 meters; the way to assure that they do not run into hostility, from this cause, is to have, in place, clear rules for them, and everyone else, to follow.

The Commission asks for comments regarding possible HF CW privileges for code-free licensees. I believe that such privileges would be counterproductive to the objective of populating the higher bands, as well as creating significant monitoring and enforcement difficulties. Even if, in order to comply with ITU regulations, they are precluded from contacting stations outside the U.S. their signals would, nevertheless, travel beyond national boundaries. Additionally,

enforcing such a ban would be almost impossible.

I believe that the Commission's proposal to eliminate the Novice Class License is counterproductive to that class's long standing objective of introducing new people to Amateur Radio. As stated above, I do not feel that the proposed code-free license has, or should have, quite that same objective. It should, I believe, be aimed at bringing in the more technically inclined people who see no place for Morse Code in modern communications. The Novice Class has just the opposite objective. Its goal has always been to bring new people into the hobby in a manner which encourages them to use code, and thus improve their skills with it - the more traditional approach to Amateur Radio, if you will. In my view, the more difficult technical exam, which the code-free license should carry and is proposed by the Commission, will be a significant deterrent to new people, who might otherwise enter Amateur Radio via the Novice License. Having both code-free and Novice Class licenses will provide a dual entry point to Amateur Radio. This could be very beneficial in recruiting the greatest number of new Amateurs. I see no reason why the Novice examination cannot be integrated into the VE system, either with or without reimbursements. The reimbursement involved is not significant in terms of the spending habits of most of today's young people. Provision for a way to handle cases of real financial hardship could, however, be included in any new rules and, if instituted, should apply to all license classes.

I contend that the Commission's proposal to eliminate the Technician Class License is also unwise. The Technician Class constitutes a general VHF license, allowing those who are interested only in that part of the spectrum full privileges. A significant percentage of people whose main interest is VHF operation are Technicians. Many of them do not upgrade simply because they have little interest in HF operation. Some weak signal VHF operators are Technicians - although a much larger percentage hold higher grade licenses. I recommend that the Technician Class license be retained and that code-free licensees, who pass the 5 word per minute code test, be upgraded to Technician. Code-free licensee who pass the 13 word per minute code test would be upgraded to General Class. The Commission's proposal to forever saddle code-free licensees, who pass a code test, with a callsign suffix is unwieldy, unfair and unnecessary. It seems to me that the Commission is merely taking on an additional monitoring and enforcement burden which is inconsistent with tighter budgets now in vogue. I do not believe that the increased burden of issuing upgrade licenses is greater than the hardship and headaches the Commission will be generating with perpetual suffixes.

The Commission proposes to issue code-free calls from the same block as Novice. In my opinion, a better approach would be assign a new callsign block to them, for example 2 by 4s, or 2 by 3s beginning from the end of the alphabet, e.g. prefixes such as WZ, WX, WY..., KZ, KX, KY.... When, and if, a code-free licensee upgrades; he or she should be given the option of obtaining a new call or keeping the old one. While such an

approach makes monitoring more difficult, it is exactly the policy being followed today.

Keeping both the Novice and Technician Classes, while adding a code-free class, still falls within the Commission's need to keep the total number of license classes to six. I have received information that the volume of Form 610s the Commission processes each year, has become a problem. This is, apparently what led to the proposal to eliminate the Novice and Technician licenses. I sympathize with the Commission's dilemma in this case, but suggest that it is attacking the wrong end of the license ladder. I would rather see the Advanced of Extra Classes dropped than the Novice and Technician. The most appropriate solution, however, would be to institute REASONABLE filing fees ($10 per filing). I believe that amateurs would support a nominal fee such as that, if the money would go directly to the Commission rather than into the general revenue. However, a $30 to $35 filing fee, with the proceeds going to the Treasury, which Congress debated last year, would (and did) meet with stiff opposition. I recognize that institution of any filing fees requires Congressional action.

What's in a name? I believe quite a bit. The Commission has followed the ARRL proposal to call the code-free license "Communicator". I consider this a most inappropriate name, as it carries the "talk on the radio" connotation, rather than the "participate in technology" approach. In other words, I believe the name "Communicator" will send entirely the wrong message to perspective licensees, as well as commercial interests coveting additional Amateur frequencies. While no name is perfect; I propose the name "Experimenter" as better typifying the purpose which, I believe, the code-free license should serve.

Specific Recommendations

I urge the following actions by the Commission in this proceeding:

1. Institute a code-free class of Amateur Radio license called the "Experimenter Class" with a written test which is at least as difficult as the current Technician/General exam and preferably of greater difficulty, with digital questions included.

2. Provide privileges for Experimenter Licensees on 220 MHz and above with the same power and transmission modes as are now available to Technician and higher classes on those bands.

3. Retain the Novice and Technician Class License and put the Novice examination under the VE program.

4. Upgrade Experimenter Class licensees to Technician upon passage of a 5 word per minute code test and General upon passage of 13 word per minute code test. This approach negates the need for special suffixes forever carried by code-free licensees who have passed a code examination. If this requires the elimination of a license class, drop the Advanced and/or Extra. I believe that such action should be a subject of a separate Rulemaking, however.

5. Issue distinctive callsigns to Experimenter Class licensee but allow them to retain these calls upon upgrading.

6. If the Commission sees fit to grant code-free licensees access to 6 and 2 meters, institute new rules excluding FM operation from 50.1 to 50.5, 144.1 to 144.5 and 145.8 to 146.0 MHz. Some provision should also be made to protect weak signal modes in the 220 to 225 MHz (or 222 to 225 MHz) band, but the specific band segments so protected must await ongoing allocations proceedings. I urge the adoption of these protected segments whether or not a code-free license is instituted and regardless of its privileges. The situation is becoming intolerable in many areas even under the existing licensing structure. I am currently preparing a separate Rulemaking Petition on this subject.

Respectfully submitted,

William A. Tynan

512. Re: Interesting posting on ship-to-shore stations

While on a Carribean cruise, I was able to wrangle a tour of the radio room. Thinking that a commercial enterprise would have the most up-to-date equipment, I was surprised to see an 800 watt HF rig (complete with code key). The frequencies were different, but it had nothing on my old TS520.

While there was a VHF packet (X.25) link via satellite to the home office, it wasn't primarily used because it was too expensive. What got used was a clunky 110 baud modem connected to a radiotelephone that operated over HF (and who said HF was dead :-). On the other end of the modem was a PC.

If you have the opportunity, tour the radio room of a commercial ship. They seem to be heavily into "cheap" and "reliable".

I have to agree with Ken about the effectiveness of CW as a weak signal
medium at VHF/UHF/SHF, when there is a human on both ends of the equipment.
However, with computers on both ends of the circuit, this no longer holds.

As far as protecting the weak signal portions of the bands from the
communicators, remember, we have CW only subbands on most of the vhf/uhf
bands. IF YOU DON'T LIKE PHONE OPS WORKING WEAK SIGNAL, STAY IN THE CW
SUBBANDS!!! I seriously doubt that all that many communicators are going to
be interested in weak signal anyhow. I think they'll be too busy yaking on a

repeater or working packet to care much about us folk who dig the weak ones out of the noise (whether ssb or cw!!!)!

Hear hear!!! Three cheers for a return to the good ol' days of
only 3 license classes!!!

Ain't having just 3 classes a "tradition??"

Communicator, Novice (I always spelled it "Novoice"), and NewWaves.
The other way to look at it is that you get an HF endorsement!
The international rules DO NOT specify a code speed, only some
kind of demonstrated proficiency!!!!

I, too, have had very good dealings with Ross Distributing of Preston, ID. I can similarly vouch for many of the hams in northern Utah; Ross supplies a lot of the radios there. His prices are normally quite good, Idaho has (had) no sales tax and when I got my TS430S (1985) they DID accept credit cards though they charge a fee (maybe 2%) to handle plastic. It all seemed quite fair to me; pay cash and get the best price otherwise don't complain if the retailer wants to keep his meager profit.

BTW Ross did us quite well at the WIMU hamfest, he was quite cooperative in procuring the grand prize as well as providing a good number of lesser prizes and grab-bag items.

Ross started out as a Western Auto franchise. When he got his licence and wanted to get some equipment he discovered that it was kind of difficult to do so in that area. He started selling radios along side wrenches. After a few years the radio buisness got so good that he gave up the WA franchise and stuck with radios. I believe he DOES do scanner buisness. All that Ross has become is a testament to a retailer who still believes in giving the customer a fair shake and an honest deal.

I am not connected with Ross Distributing but thought you could use some personal experiance and observation of their buisness.

Ron, K3FR

517. Extra exam matter and code

Newsgroup: rec.ham-radio

>>> OK, so CW is "relevant" if you're going to operate in the "weak signal
>>> portion of the band." Now please explain why it is "relevant" to GETTING
>>> A LICENSE in the first place.
>
>>It is OBVIOUSLY RELEVANT for any license that grants privelege to
>>operate in the weak signal portion of the band. Hence, my comments to
>>the FCC regarding their ill advised no-code license, in which I urge

One way to look at things is that if CW was tested as rigorously as
the technical theory, there would be a few questions on the novice test
like :

The name of a system that uses long and short signals to encode
letters and numbers is:

a) Morse code
b) long-and-short (L&S) code
...

On the extra exam, you would get some questions like:

The morse translation for the letter Q is:
a) ._._.
...

It would of course be possible to miss all the CW questions and still
pass the test.

New idea (I think):

Element 4b is broad but not very deep. Face it, figuring out
RC time constants isn't real deep stuff for the "cream of the crop"
license grade.

I think it would be in keeping with the idea of incentive upgrades to
have some broad test like 4b, plus an in depth specialty element.
Communications theory, digital, microwave, TV.... Pick any one, but you
have to know your stuff! 20 wpm code would be just one of the
choices. To keep ITU etc happy, we can require a lower code speed for
those who choose a technical specialty, or drop it for vhf and up.

This would put things in a little better perspective: that CW is important,
but it is only one mode, along with TV, packet, phone, and all the others.

With some adaption, this plan could accomodate all those non-code hi-tech
gurus we are supposed to be alianating.

Some people said I was bitching about the extra exam because I hadn't taken or passed it. Now I can bitch from experience! I even know the secret handshake.

Cross-posted to: rec.radio.shortwave,rec.ham-radio

I was listening to my newly crystalled Ten-Tec 580D yesterday, and I came across a digital signal on 10.2808 MHz. I hooked up my pk-232 and found it to be a TDM (Time Division Multiplexed) 1:4 signal. I sucessfully decoded some information, (I don't want to divulge it's contents) but alas, it was in French! Does anyone know where this signal originates and to whom it belongs? If you have the proper equipment, it might be interesting to listen to. Any help will be greatly appreciated, thank you in advance.

Let me quote again from your original message:

> I have said this before and been shamelessly flamed. I will say it
> again, maybe people will learn to read and ponder not scan and emote.
> Imternationally, the only reason for amateur radio is self training
^^^^
> and experimentation. In most of the world "H&W Traffic" etc is third

So, I think I interpreted your posting correctly. If you didn't _mean_
to say that emergency communication is not an internationally recognized
reason for amateur radio, fine, but that _is_ what you said.

> While I have your attention, let me say that I do not appreciate your
> snide comments to me on an open forum. Also I am somewhat annoyed that

Those who live by the sword...

> I should have to put up with impertinence from someone who is an
> employee of an organisation that I support with my fees.

I think this comes under the heading of attacking the messenger because
you don't like the message.

Regarding the point (there is a point, once we cut through the flaming),
I think the following material from the international regulations is
instructive. And yes, Julian, I got this material from the library

here. I sometimes use the libry for research so that I can disseminate material to counter erroneous information posted on the net.

=====
International footnote 510 (From the Radio Regulations, Geneva 1982):

510--For the use of the bands allocated to the amateur service at 3.5 MHz, 7.0 MHz, 10.1 MHz, 14.0 MHz, 18.068 MHz, 21.0 MHz, 24.89 MHz and 144 MHz in the event of natural disasters, see Resolution 640.

RESOLUTION No. 640

[TITLE] Relating to the International Use of Radiocommunications, in the Event of Natural Disasters, in Frequency Bands Allocated to the Amateur Service

The World Administrative Radio Conference, Geneva, 1979

[I won't quote the whole thing. It's about use of the amateur bands by nonamateur communication providers in time of emergency. But there are a couple of interesting sections...]

considering

a) that in the event of natural diaster normal communication systems are frequently overloaded, damaged, or completely disrupted;

...

e) that under those circumstances the stations of the amateur service, because of their widespread distribution and their demonstrated capacity in such cases, can assist in meeting essential communication needs;

f) the existence of national and regional amateur emergency networks using frequencies throughout the bands allocated to the amateur service;

g) that, in the event of a natural disaster, direct communication between amateur stations and other stations might enable vital communications to be carried out until normal communications are restored;

...

etc.

The following licensing idea came to mind after reading all of the
notes in this file about the "Communicator Class" and "Incentive
Licensing"

We could actually use our current system (already in place) and
accomplish much of what everyone here has said or commented on.

The goal of this proposal is two fold:

1. Entry Level --- to get more young and non-technical people
into this hobby.

2. Have those already in the hobby expand their knowledge of the
various aspects of this hobby.

3. Make the administration of the licensing procedure less complicated.
(not sure anything the government does is not complex)

Class Elements Options

Novice 2 CW 5 WPM

Technician 2,3a Pick (1) from list below

General 2,3a,3b " " " " "

Advanced 2,3a,3b,4a " " " " "

Extra 2,3a,3b,4a,4b " " " " "

Communicator 2,3a * (required)

Option List: (Aside from the code Exams these tests will be 25-30
multiple choice questions designed in the same manner
as we have our tests designed today however the pool
of questions should not be made public)

a. Packet
b. RTTY
c. CW 10 WPM
d. CW 15 WPM
e. CW 20 WPM
f. Microwave
g. Emergency Service / Operations
h. Net Operations / Control
i. SSTV
j. Community Service
*k. UHF/VHF Operations
l. Satellite

(The above list is not all inclusive)

All current allocations and privs remain the same.

All current licenses are grandfathered.

If the the current proposed Communicator Class is approved the 5 WPM
Code will be required for upgrade to Technician. (this assumes that
the VHF/UHF privs are different for Technician and Communicator.

The desired results here are that:

1. Everyone can get into the hobby.
2. Those with higher levels of license have a good background into
more of the hobbies aspects.
3. We can maintain the same licenses structure and have it mean more
to be a certain class then it does now.

Well as I said in a previous post, if you want to change the discussion from cramming broadcast TV into adjacent channels to dropping public safety channels into the broadcast forbidden channels, then you will get little argument from me. The additional interference to viewers would be minimal except for those few who lived next to the police base stations. I consider this a reasonable tradeoff. I do consider unreasonable causing interference to thousands of viewers by placing broadcast TV signals on adjacent channels. What has actually happened in LA is that the LA county sheriff's office has taken over TV channel 14 AND the FCC has declared NO new TV licenses will be granted on TV channels 15, 16, or 17 within 75 miles of LA county TO PROTECT THE SHERIFF'S DEPT. Since public safety radios are essentially the same radios as amateurs use, I mentioned the amateur coordination example. I feel the FCC's action was excessively conservative. Many broadcasters have become vehement about protecting their spectrum following this precedent setting action. This has become primarily a political problem rather than a technical one. If the FCC reverses itself, many broadcasters will once again be receptive to public safety dropins.

shouldn't I ask the FCC to require a typing proficiency test of all applicants?
After all, they'll have the privileges to operate RIGHT ALONGSIDE OF ME!!!
HORRORS!>>

Hear, hear!

I would add that a typing test is certainly more relevant to 1990 communicationsthan is manually-encoded, manually-decoded morse code.

The time has come for us to stop requiring proficiency in one mode. No-code would not have made sense in 1950. It makes lots of sense today.

I would be indifferent towards adding a technically-qualified new ham who knew code and a technically-qualified new ham who knew digital techniques. The odds of our highly-popular yack-yack bands getting any more or less congested would be the same in either case. But the odds of a new technological development would be arguably better by letting in the digital person.

Attachment to morse code is fundamentally an emotional issue. Everyone has a right to his or her opinions, and there's nothing wrong with human emotions. But we should all admit to ourselves exactly why we believe the way we do.

Bottom line: everyone had a chance to comment by August 6 and try to convince the Commission to see things his or her way. Now it's up to the Commission to make a decision. I'll be glad when this is settled. (But I'll bet that, if a no-code license is created, we'll still be hearing complaints about it a quarter-century from now, just like incentive licensing... those emotions sure last a long time!)

Todd Enders says, among other things:
> As far as protecting the weak signal portions of the bands from the
> communicators, remember, we have CW only subbands on most of the vhf/uhf
> bands. IF YOU DON'T LIKE PHONE OPS WORKING WEAK SIGNAL, STAY IN THE CW
> SUBBANDS!!! I seriously doubt that all that many communicators are going to
> be interested in weak signal anyhow. I think they'll be too busy yaking on a
> repeater or working packet to care much about us folk who dig the weak ones
> out of the noise (whether ssb or cw!!!)!

I know of no FCC-mandated CW-only portion of any UHF ham band.

MY concern, and that of some others, is that the no-code folks will be doing their FM yacking and packeting in the band segments now used for Weak Signal SSB, etc. (esp. 50.1-50.5 and 144.1-144.5). There is no FCC-promulgated word that gives a hint that FM rag-chewing is inappropriate in these portions of the bands. ARRL band-plans are generally a mystery to many experienced hams; there is no reason to expect that the newcomers will hear of them, or follow them. Please read W3XO's comments on 90-55, which I posted last night.
W3XO does the "World Above 50 MHz" monthly column in QST.
I have not seen W1EJ's comments, but I understand that Tom is also asking for the FCC to establish NARROW-BAND-EMISSION subbands on vhf-and-up. W1EJ is on the ARRL VHF / UHF Advisory Committee (which does the band plans) and was its chairman last year (and not too happy with the ARRL hierarchy). My understanding is that W3XO and W1EJ do NOT intend that no-coders be restricted from these segments.

I always use vertical-caving equipment for safety when working on towers. I wear a nylon rock-climbing seat harness, and attach myself to the tower with a loop of 1" tubular nylon webbing and a carabiner (snap link). The nylon harness is very comfortable, and allows the user to sit down and rest anytime. Nylon is less abrasion-resistant than leather, but is stronger and does not rot.

Tower climbers' traditional leather belts are obsolete by climbing/caving/vertical-rescue standards. It is important that the harness pass under the hips, forming a seat. An injured or unconscious person hanging by a waist belt has short life expectancy: The belt moves upward, constricts the chest, and may cause suffocation.

Safety devices for tower climbing which slide upward and lock are available but expensive, usually requiring that a track be permanently attached to the tower. I use 7/16" nylon "cave rope" and _Jumar_ Ascenders or variants: The Swiss-made Jumar clips securely onto the rope, and slides upward with little friction. A toothed cam grips the rope to prevent downward movement. In electrical terms, it is a rope rectifier. :-)

A pair of Jumars are normally used to climb rope; there are many configurations of ascenders and harnesses (see reference). The legs, which are much stronger than the arms, do the work of climbing. The climber can stop and rest at any time, hands free. An experienced person of average strength can climb 1000 feet of free-hanging rope in less than one hour.

For tower work, I like to climb the tower itself and use a Jumar safety on the rope (which is installed by pulling over a pully at the top of the tower by a permanently-installed nylon string). Another Jumar provides safety when hauling loads up the tower, so they can't fall if someone drops the rope.

You need a rope to pull up antennas, etc. when working on towers anyway, so may as well get a good one and use it for safety too.

Do not trust your life to a rope not made especially for climbing (see reference).

Climbing back down a tower is work; it's easier, safer, faster and more fun to rappel down the rope. I use a "rappel rack" variable-friction device. A heavy object (or injured person) can be lowered from a tower very easily by using a fixed rappel device to control descent.

ALWAYS wear a (nonconductive) hard hat with chin strap when doing tower work, whether you are on the tower or providing ground support.

The abovementioned equipment and techniques work reliably in extremely nasty environments, in normal and rescue situations. Adapting them to tower-climbing is easy, but read about it first, and consult someone experienced: Subtle nuances like knots (*) are vital to safety.

(*) As recently mentioned in rec.ham-radio, the Boy Scouts no longer teach Morse code. Do they still teach knots? Most of the knots in the BS Handbook are utterly worthless and dangerous in the context of climbing.

On that subject:
My house was burgled earlier on in the year, amongst other things
stolen was my FT23 VHF handheld. I gave the serial number to the police
and expected to hear nothing from them again.
About 6 weeks ago I got a call from the police to say that my
radio had been recovered after a high speed persuit that led to the arrest
of a bank robber. It appears that he was using the radio to listen to the
police frequencies. (I had pulled the strap to enable the extended frequency
coverage.)
Well, the FBI have my radio now, and it will be used as evidence
in his trial. I was told that I might expect it back in about 8 months!

I don't think that anyone can reasonably argue with the above; I know I can't, nor will I try. What's missing, though, and what started this whole mess, is some justification for *requiring a test of CW proficiency* in order to become a licensed amateur. That fact that CW is a useful technique under certain conditions does NOT, at least in my opinion, constitute such justification. Especially in light of the facts that other modes shine equally bright in their own "special domains", and even CW may be used WITHOUT the operator having any particular proficiency, given modern technology. Which is the "better ham": the kid who can copy and send 25 WPM flawlessly into his store-bought rig, or the one who builds his own CW keyboard which can easily do 40 WPM? Can't decide between them? Neither can I - there are arguments either way. So why can one kid get the license, while the other one can't?

It looks to me as if the Germans want the R1 to be a ham-bands rig.
The French restriction just looks non-sensical to me.

Has anyone any information, anecdotal or otherwise, about carrying a
radio with "prohibited frequency coverage" while traveling.
For instance, apparently carrying my R1 in a car in NJ is illegal
(maybe just having it turned on in a car is illegal).
What about other places?
What about the issue of the appearance of the R1 (sure looks like a
HT to me), or other scanners?

I have an R1 on indefinite loan, and I think the user interface leaves
something to be desired. Maybe I'll get used to it.

>>> A LICENSE in the first place.
>
>>It is OBVIOUSLY RELEVANT for any license that grants privelege to
>>operate in the weak signal portion of the band. Hence, my comments to
>>the FCC regarding their ill advised no-code license, in which I urge

One way to look at things is that if CW was tested as rigorously as
the technical theory, there would be a few questions on the novice test
like :

The name of a system that uses long and short signals to encode
letters and numbers is:

a) Morse code
b) long-and-short (L&S) code
...

On the extra exam, you would get some questions like:

The morse translation for the letter Q is:
a) ._._.
...

It would of course be possible to miss all the CW questions and still
pass the test.

New idea (I think):

Element 4b is broad but not very deep. Face it, figuring out
RC time constants isn't real deep stuff for the "cream of the crop"
license grade.

I think it would be in keeping with the idea of incentive upgrades to
have some broad test like 4b, plus an in depth specialty element.
Communications theory, digital, microwave, TV.... Pick any one, but you
have to know your stuff! 20 wpm code would be just one of the
choices. To keep ITU etc happy, we can require a lower code speed for
those who choose a technical specialty, or drop it for vhf and up.

This would put things in a little better perspective: that CW is important,
but it is only one mode, along with TV, packet, phone, and all the others.

With some adaption, this plan could accomodate all those non-code hi-tech
gurus we are supposed to be alianating.

Some people said I was bitching about the extra exam because I hadn't taken
or passed it. Now I can bitch from experience! I even know the secret
handshake.

535. Re: Bearcat 250 scanner problem.

Newsgroup: rec.ham-radio
Date: 1990-08-16 00:21:02 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <4630015@hpspkla.spk.hp.com>
Source record: 9155

My father has a Bearcat 250 scanner which has exhibited similar problems in the past. The main problem in his case has been the poor thermal design of the power supply regulators. TO-220 pass transistors are dissipating nearly 3 watts without any heatsinking what-so-ever. They get very hot!

It sounds like your problem may be an intermittant pass transistor. The pass transistors dissipate power as long as the scanner is plugged in. Unplugging the scanner would remove that power allowing the temperature to change and connection could be re-established.

The best thing to do would be to get it into the failed mode and measure the supply voltages. I don't have a schematic so I cannot give specific instructions as to where to measure.

If this turns out not to be your problem, while you are in there put some kind of heatsinks on the pass transistors. It could prevent future grief...

Um, what is it about this magical talisman called CW that keeps them FM yackers away from those precious weak signal slivers? ;-)

Seriously, given the interest level in weak signal work, do you really need more than 50 KHz in any band?

>bands.

This is not true. We only have CW only subbands on 6m and 2m. In addition, they are totally ineffective at providing the kind of protection the weak signal operaters need. We need a few hundred kilohertz (on 2m) of guard space before there are any (relatively) wide-band signals like FM, because they raise the noise floor to unacceptably high levels. (Much more space is needed on the higher bands; the protected space needs to be allocated as a percentage of the operating frequency.) In addition, common practice is to use the calling frequency, +/- 100 kHz or so (depending upon crowding) for SSB _and_ CW. Also, pre-arranged contacts like meteor scatter are commonly arranged 200-300 kHz higher than the calling frequency. These people also need protection from the FM'ers. The _only_ time that the CW sidebands on 6m and 2m are used to any extent is when there is an auroral opening, and people like me are trying to get away from the _LIDS_ who refuse to use CW when it is absolutely required. The CW only subbands are not significantly used even during contests! This should not be construed to mean that CW is not used. CW is used extensively during contests, and indeed for most weak signal work. While we don't need CW only subbands on VHF and above, we need to make sure that all users of the weak signal portion of the bands are competent to use CW; 5 wpm does not constitute competence, but in my mind, 13 wpm is good enough.

We use 1/2" *Static* Kernmantle rope for rescue. Unlike mountain climbing rope, it does not stretch.

>Climbing back down a tower is work; it's easier, safer, faster and

The "rappel rack" has the unfortunate property that it can come completely off the rope if mishandled. It is good for VERY long descents, but not optimal for reasonable descents by not-too-experienced folks. We used a "Figure 8" with ears for rescue work. It can't come off the rope.

The same comment (can come off the rope) applies to the Jummar ascender. A Gibbs ascender is safer for the less experienced.

>The abovementioned equipment and techniques work reliably in extremely

Yes, I was surprised to find that knots used with nylon rope are entirely different from knots used with manila rope.

>their polarity? I mean, besides the destructive method?

"Gunn Diodes" aren't diodes!!! There is no pn junction!!! It's just a chunk of GaAs, doped, with metalized contacts on both ends. You can use it in either direction.

Just increase the voltage slowly, and don't ever put the voltage above 10 V or so if you have it oscillating. Make sure it's in a proper cavity, with a proper load. (Placing the "diode" 1/4 lambda from the open end of a piece of waveguide, with the other end open, is good enough. You will be radiating, but I was only talking about protecting the "diode".)

The way I see it, if you want to try to use phone during a weak auroral opening, that's your choice. I wouldn't consider somebody a lid because they prefer phone to code. I'm sure everyone agrees that code is a lot easier to decipher when aurora-ized as compared to phone. But I'm not sure I agree that using a mode that is not optimum for a particular band under particular conditions makes someone a poor operator. I have never been in a VHF contest here on the east coast where there is not enough room left for the CWers, even in the SSB subband. During auroral openings there is plenty of room for CW, even when mixed with those on SSB making normal tropo and LOS contacts.

I won't comment much on the code speed opinion. However, I'd much rather hear 10 WPM than 20 WPM during an auroral opening. It usually lasts long enough that the extra speed isn't necessary to complete the QSO and only makes tough copy even tougher.

I have had to ask, politely, a couple of Extra Class FM ragchewers to move out of the satellite subband to allow me to copy DOVE. Yes they were rag chewing on 145.825, a frequency they said they had been using for years. Of course, since DOVE uses FM, I guess you think it should move out of the satellite subband too. The bandplan is voluntary now, of course, but the FCC officially recognizes 145.8-146.0 as a satellite subband so Extra Class amateurs with their superior CW skills should have known better. In fact, like most amateurs, these two Extras were gentlemen and allowed me to copy DOVE then asked about amateur satellites. We gained two more satellite enthusiasts that day. I think that keeping the bandplans voluntary is in keeping with our spirit of self regulation. In this one case it exposed two old timers to a new mode.

CEO summary:
A while back in this newsgroup, there was a question as to whether Marlon Brando was a ham and if so was he still active. The general consensus was that the answer to both questions was, "yes."
Last night, on the TV news, there was a bit about Marlon having to bail his son out of jail. Apparently, he put up his "5 million dollar estate" as collateral. At this point, they cut to a 3 second helicopter shot of the estate. It was quite easy to see what appeared to be about an 80 ft tower with a 3 element beam on top.
It's on top of a hill, too!

>when hiking. The idea is that I like to go hiking, mountain climbing,
>and such but I tend to be a lot slower than the people I usually go

I am an experienced hill-walker and I teach and have always been taught
that the most important aspect of hill walking is the concept of going
in a group (unless your on your own:-). This group has a leader and
EVERYONE STICKS TOGETHER unless a formal decision is made to split the
group. Just letting someone fall behind is BAD LEADERSHIP.

>with. To make matters worse they usually are the ones that know where
>we're going. This has made for some very interesting and memorable

If your 'leader' knows you cannot navigate, he obviously cant have
any consideration for YOUR safety if he is prepared to "loose you".

Your cheapest and most reliable solution is LEARN TO NAVIGATE
books should start about 10 dollars, and once learned it is a skill
that brings great satisfaction in its own right.

By all means carry HT's on the hill (I always do) but they are NOT
a substitute for good mountain practice and procedure.

<Sorry about the repost, the first try of this got truncated before the
list on the ArpaNet (Internet, whatever) side of things...>

Well, this certainly seems to address alot of of the issues surrounding
cellular phone service. Kinda kills the objection about cells getting
knocked out during natural disasters, doesn't it? As a friend of mine
observed dryly, "if we have a natural disaster that makes it impossible
to talk to an orbiting satellite, a 2 meter HT probably ain't gonna
do much good either. We're talking serious atmospheric ionization
here." :-).

Anyway...

In anticipation of the "it'll never work" discussion that I know (and
the reader should know) is coming, I would like to present today's Top
10 List with apologies to Late Night with David Letterman....

From the Home Office in Scottsdale, Arizona....

Top 10 Reasons Why Hams Think Motorola's Iridium System Will Never
Work...

10. Can't buy equipment from major Ham equipment manufacturers.
9. All those 900 numbers lead to undisciplined use of spectrum.
8. No allowance for use of CW in "high noise" environment.
7. Uses "evil" DSP techniques.
6. Not available in HeathKit version.
5. No exam required for upgrade.
4. Wrong numbers won't understand when you shout "CQ DX"
at them.
3. I TOLD YOU this would happen when QST did away with
"The World Above 900 MHz!"
2. It's yet another example of the "appliance operator" mentality.
1. Takes all the "challenge" out of global communications.

Flames to /dev/null please.

Bob Witte is quite correct. You may not LEGALLY use a Marine VHF for land-only. Ship to ship and ship to shore are the intended uses. I believe that one could use Marine VHF for hiking and never get caught.

Handheld Marine VHF transceivers can be purchased for as little as $150 by looking in some marine catalogs. Those Radio Shack units can be had for as little as $175 if you look around (they are really REGENCY radios).

Another suggestion would be to use the belt clip (true) walkie-talkies that are sold by Radio Shack. I am told that they function quite well.

Well, first off:

Thanks to those of you trying to point out that CW proficiency is not required following the "big one". An AM transmitter is a bit more difficult to construct than a spark-gap transmitter, right? The same rusty bolt that can detect AM can detect CW, right?

No, I'm not foolish enough (as some of you seem to think) to believe the ORIGINAL requirement for CW proficiency was EMP. You sure know how to twist others' words to your benefits, don't you? The discussion is the CURRENT relevancy of CW.

We are still practicing a HOBBY, and for that reason as well as the emergency communications aspect, CW is relevant.

I don't enjoy working CW, but I'm adult enough and intelligent enough to see the need to maintain the CW requirement for specific PORTIONS of our spectra. C'mon guys, don't attack ANY mode, simply due to your OWN prejudices against them. I never will; I know better.

I strongly suspect the 88-108 restriction in French models is to avoid an import duty. This band is used for wide-band FM bcsts as in the U.S. The band below 87.5 contains the two-way business radios, etc.

Judging from comments made in Monitoring Times, Germans cannot legally listen to non-ham non-commercial bcsts. But I bet many do!

551. Cellular on unmodified PRO-34???

Newsgroup: rec.ham-radio
Date: 1990-08-16 15:44:04 UTC
From: charlie@oakhill.UUCP
Message-ID: <3686@radio.oakhill.UUCP>
Source record: 9162
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I am hearing what appears to be cellular calls on my
un-modified PRO-34. They appear in the middle 800 MHz
band that the '34 allows you to receive. This is
interesting since the 'excluded' bands of 870-890 is
where cellular is supposed to be. Am I hearing another
type of service? I hear all the beeps and squirts you
normally associate with the audio band signalling of
a cellular call-in-progress.

What other services besides cellular 'sound' like cellular
and are located in the frequencies that the un-modified
PRO-34 receives? I suppose this could be an image I am
hearing. A friend of mine hears this on his '34 as well.

From: root@tosspot.UUCP
Message-ID: <1c5ZN2w162w@tosspot.UUCP>
Source record: 9150

An observation -

The people of AMSAT are doing a great job of producing amateur satellites. Their ever increasing complexity and abilities (the satellite's, that is) are wonderful.

What a pity it is that most amateurs outside North America (and a good proportion within NA) can't afford the expensive additional hardware to use them.

(No, I don't want anyone telling me how they built/bought a complete 430MHz-light all mode rig for $5.95 or an az/el rotor for zilch out of a erector set - I'm thinking of of two things - money is a problem for most of us and outside of the first world it can be hard to even find the components even if you are a genius engineer....)

Anyway, I guess that technology for technology's sake is a good thing, it's just a pity that ordinary hams with ordinary stations and income levels have to use the Russian satellites if they want to use satellites at all....

What're the odds that the first ever geosynchronous AMSAT will need oodles of bucks for the "who cares, it's a neat technical hack!" esoteric up and downlinks....?

Nothing like it - space communications for hams, provided they can afford it......

....Halon system at the ready.....

556. ARRL MICROWAVE HANDBOOK

Newsgroup: rec.ham-radio
Date: 1990-08-16 16:36:44 UTC
From: ka1gt@cbnewsm.att.com
Message-ID: <1990Aug16.163644.26309@cbnewsm.att.com>
Source record: 9163

The long promised ARRL Microwave Handbook (I think its really called the UHF/Microwave Experimenter's Handbook or similar) is finally in print. I got my (author's) copy this morning. I havn't had a chance to read it in any detail yet, but on first glance it seems quite well done. It concentrates on basics rather than any detailed equipment design. That may come in a second volume, since I know that such designs were solicited (and submitted) when the project was started several years ago.

557. New License Classes

Newsgroup: rec.ham-radio
Date: 1990-08-16 18:09:57 UTC
From: randall@infmx.UUCP
Message-ID: <5006@infmx.UUCP>
Source record: 9079

I'll throw my hat into the ring with another suggestion for new license classes. How about this:

1. "COMMUNICATOR" 2,3A No code All priv. above 30mhz (except CW side bands)
2. "GENERAL" 3B 5 WPM Privs now enjoyed by General Class
3. "ADVANCED" 4A,4B 13 WPM All amateur privs

This seems to be a compromise. Code requirements are greatly reduced, but they remain for the HF bands. "Qualification-based licensing" is reduced, but some elements of it are retained. The novice class license is eliminated, because it no longer makes sense if we're going to have a Communicator class. The novice class will just confuse newcomers ... "Is Novice better or worse than Communicator? ... difficult to answer, since the classes would not be hierarchically structured. The Communicator would be a good entry point into ham radio, since the written exams would not be that difficult, and this class would have good voice privileges. With only 3 classes, the licensing process is simplified.

Sure, any you can't LEGALLY use a 2 meter HT either, but you PROBABLY won't get caught... This is irresponsible, Marine frequencies are for for MARINE use, AMATEUR freguencies are for AMATEUR use. Using either without a license or on land in the case of marine, is strictly illegal and can cause harmful interference. Please use CB or get an amateur license.

Well, I certainly know what you mean about "not advertising", but I
guess that I have a story...

When I said that I wondered what would happen (above) I was
talking about a state that I am not familiar with. In Minnesota,
hams are exempt from "scanner laws".

I was parked in a popular summer town talking to a couple of
other people between our respective parked cars. I was interested
in finding out what the local law enforcement people were doing, so
I put my '701 on band scan. I was waiting for it to find something
when a sheriff's car pulled up to see what we were drinking (pop
of course). :-)

Well, while he was parked next to me he ran the plates on
both cars and guess what? Yup, my scanner finally stopped and
HIS RADIO FED BACK THROUGH IT! I just walked over and turned it
off and that was the end of that.

I guess that the only thing that I have to say about this is
that Minn. luckily is not one of the states in question, and I
hope that my actions did not damage amateur radio's standing.

565. Zepp Antenna Design

Newsgroup: rec.ham-radio
Date: 1990-08-16 21:11:55 UTC
From: sawyer@twg.com
Message-ID: <7768@gollum.twg.com>
Source record: 9170

I am getting ready to put up a large double extended Zepp antenna (IF I can find any 12 ga. copperclad and IF I can find somebody crazy enough to go up the giant redwood that will be one of the supports). I have a span of approximately 300 feet to use, and the feedpoint will be about 175 feet above ground level. This will be used mainly for 160 and 80 meter DXing, though it could be used on the higher bands. My question is whether to fill as much of the span with wire as I can or whether to cut the wire to be resonant on the 160 meter DX slot. I remember seeing an article somewhere recently on using a 160 meter loop on the higher bands, but nothing about a Zepp. Does anybody on the net have any experience with this, or know of a reference?

> -Charlie
> WB4HVD

You are receiving an image (at 21.4 Mhz higher) of the cellular frequencies; My PRO-34 also receives them. However, once I made the modification to allow cellular, the calls are much clearer and there is no digital signal interference; i.e. when you are using the search mode you only stop on conversations.

The major users of the 800 mhz spectrum (outside of the cellular bands) are so-called trunked radio systems. Many users, using a combination of CTCSS and a digital channel, multiplex conversations over a fixed number (6 or ten or so) of channels. The digital channel allows the transceiver to pick an unused channel for each transmission, while the CTCSS prevents other users from hearing transmissions that are not of interest to them (of course since the PRO-34 passes the CTCSS signal, you will hear all users of the channel).

569. Comments on various current issues

Newsgroup: rec.ham-radio
Date: 1990-08-17 00:47:08 UTC
From: gaus@glacier.crd.ge.com
Message-ID: <11128@crdgw1.crd.ge.com>

After scanning through the news for several weeks, I have found several topics of interest to me, and I would like to offer my comments on them, which I believe are constructive additions to the various discussions.

As a matter of introduction, I am a 38-year old extra class amateur radio operator licensed since 1967. I am a 100% CW operator whose interests encompass simple and economical antennas for Hf, propagation, traffic handling, DXing in connection with the study of antennas and propagation, and taking the time to discuss any topic of interest with another ham.

Here are the issues of interest to me and my comments:

1. Reasons for keeping CW.

a. Its relatively small bandwidth makes good use of the limited amateur spectrum, thus enabling many QSOs to take place over a given frequency range. This feature is something that will become increasingly a factor in the near future as demands are made not only from within amateur radio but from without for more frequency spectrum.

b. A message has a better chance of getting through under conditions of weak signal, interference, or noise.

c. International communication is straightforward and simple with predefined Q signals and other accepted amateur abbreviations.

d. Its simplicity enables any amateur, who is assumed to have a fundamental knowledge of the art and science of radio communication, to signal in the event of emergency when this most basic form of communication is required. The most appropriate instances are when one is isolated during an accident or natural unnatural disaster and other means of communication either do not work for reasons of equipment failure or because of inadequate signal levels at the receiver.

e. CW is a skill that is achieved through the expense of effort. My personal belief is that something is appreciated more if one works toward a goal and achieves it as a result of his own ability and work. Something has little value if it is given outright with no corresponding expense of energy on the part of the recipient. In the present case, that something is the privilege to operate an amateur radio station.

f. CW is a continuation of a form of communication that originated more than one hundred years ago, if not sooner. Today, it not only is still a proven fundamental means of communication, but it is an art form and a skill to achieve and to improve upon. It provides the user the opportunity to set several goals for desired levels of proficiency.

g. CW permits one to have a conversation with another at a speed which is comfortable to the operator, and as a result, permits the operator to organize his thoughts so that a coherent and continuous exchange can take place. That is, there can be less pauses than are found in voice communication.

Vertical antennas.

I use two vertical antennnas at my station. One of them is the old and famous Gotham Vertical. When I ordered this antenna around 1973, I ended up paying more in truck freight charges for it than the antenna itself. The antenna is just two aluminum tubes, each one about 12 feet in length, and one put inside the other for about six inches or so and secured with a screwable clamp. I have mine mounted on a ten-foot 2X4, using PCV pipe cutouts as insulators, and supported with three nylon chords from top of 2X4 to three ground stakes. The antenna, therefore, is ground mounted, and I use sixteen radials going outward from the base. The antenna is tuned with a home made tuner for 20, 15, and 10 meters. I have contacted 162 countries with this antenna using 100 watts output. In my opinion and experience with the purchased Gotham Vertical, it is simpler to build such an antenna than to buy one. I suspect that some money will be saved in the process, but a greater gain is what one learns through the effort and, as always, the satisfaction of having done something with one's hands.

I also use a vertical helix antenna that is more experimental than the above mentioned monopole. It is operated in the normal mode. Refer to Antennas by John Kraus for this type. I constructed mine out of three lengths of PVC tubing and then stretched a toy slinky down its length, with the PVC tubing inside the slinky. I still use radials and my tuner described above. I use this antenna on 80 and 40 meters. I haven't been using this antenna for very long, but its performance seems adequate. I want to see how it performs in the winter time. I would be happy to give details of it to anyone who is interested.

Kenwood TS-940s

I use a Kenwood TS-940s. There are two fans on it. One of them pulls air across the heatsink for the regulators. The other one is used in the final amplifier section. The final amp fan never comes on for me, because of my CW operation. The voltage regulator fan does come on, and it cycles on and off, which appears normal. I followed the manual's instructions and lubricated the fan after six months, and have had no disagreeable noise.

I did have a problem with the unit just before the warranty expired. I noticed instability in the received CW signals and in WWV when listening to the carrier in CW mode. Also, the power supply area seemed to be hot all the time. Sometimes the frequency display would go out completely, and I would have to open up the chassis and hit the reset button. I sent the unit back to the dealer for repair, and upon return found that the problem was apparently in the need to resolder an area of the PLL board. Since receiving the repaired unit, I have had no problems with it.

Ham Radio Dealer

In connection with the comment above, my dealer was R and L Electronics of Hamilton, Ohio. They were courteous and handled my needs promptly. I was entirely satisfied with the repair that they made to my TS-940s.

QSL Responses.

I do mostly DXing these days, but do some local contacts as well. I send out a QSL card to each new contact I make, and reply to any QSL card that I have not otherwise acted on.

I keep a list of what cards I send out to the ARRL QSL bureau and to individual hams overseas or to local QSL managers. The US managers have responded to me almost 100 percent. Foreign amateurs respond better than 80 percent.

On each request for a DX QSL card I write a small note thanking the amateur for the QSO and saying that I would appreciate his card for whatever reason I am making the request.

On stateside non-DX QSL cards, I send by U. S. mail at 15 cents per card and request a card by checking the PSE QSL box. I don't feel that I am placing an undue burden on anyone by not furnishing return postage. If I don't get a card back, that's all right with me.

DX Pileups and the DXCC award.

My own rule of operation is: listen, listen, listen. Be courteous. Be patient. Work toward the goal with reason. Let the other guy have a chance.

I call a DX station if there are few enough amateurs calling that I think I have a chance of being heard. On heavy pileups, I don't bother. In such cases, I believe it would be wise for many operators to voluntarily back off.

Some DX stations can organize the QSO by calling stations by number, i.e. NR 1, NR 2, etc. When that happens, I believe we should listen to his directions. Also, some DX stations say to call him up 1 kHz or so, but some operators miss that direction and call on the DX station's frequency. Again, listen, listen, listen.

The DXCC award certainly is a measure of one's accomplishment in operating in amateur radio, but its value should be a reflection of quality operating and courtesy on the part of those who achieve it.

Overall view of amateur radio.

It is funny that in reading the news articles of several amateurs, that some things seem to remain the same: the discussions of the applicability of CW and other modes of communication, the status of particular classes of licensees, the perceived importance of the kind of call sign one uses, the mystery of electromagnetic radiation and its application, the threats to amateur radio from within and from outside. These issues, among many others, are not new to amateur radio, because I was exposed to them when I started, and I suspect that older amateurs share a similar point of view with respect to their memories of the past.

We should not lose sight of what amateur radio is about, however. In its most basic terms amateur radio is for experimentation, education, public service, international good will, and, certainly not the least, amateur radio is for fun. We have something which contains so much value and so much potential for good for others. I believe it is something we should treasure and preserve. I feel we can best do that by treating others with respect, courtesy, calmness, and reason. There are certainly abuses within amateur radio and issues of use of spectrum by outside interests. These issues can be met in an organized way and dealt with. If, however, the amateur community as a whole cares little about its integrity, it will ultimately be splintered, and its effectiveness as a constructive resource for the community will be lost.

I have had many QSOs in my amateur radio experience, and from this I believe that most amateurs are good operators and care about their avocation. There certainly is hope for amateur radio, and that hope comes from the majority of amateurs who support the fundamental principles of amateur radio.

73,

Rick Gaus
WA3INC

P. S. If anyone would like to discuss any of the topics further with me, or anything else, I'm on CW most evenings on 80, 40, or 20 meters depending on propagation conditions. Look on 3.500 to 3.525, 3.677, 7.000 to 7.025, and 14.000 to 14.025 MHz. I spend most of my time listening for DX so you may not hear me. Call me on frequency or make a sked through email or better yet, send me a message through the National Traffic System the old CW way.

Disclaimer: The above opinions concerning amateur radio are my own and do not reflect in any way the position of the company for which I work.

Ken, that is *NOT* the whole point. To some people, and perhaps even many
people this is the point, and I won't try to tell them that they are wrong.

But where you are wrong is in ASSUMING that everyone subscribes to this
same "point". I for one DO NOT!

I am interested in finding out how far I can push VOICE communication.
Switching to CW or ATV just simply contradicts what I am trying to do.
I'm also interested in ATV and DATA DXing. In fact I am even interested
in CW DXing. But on the day I am doing VOICE DXing, you won't hear me
doing CW DXing.

> Cost effectiveness is not a justification for the CW requirement being

> relevant to the discussion at hand.

How is CW relevant to one who is doing only weak signal VOICE DXing?

> even bother sending in comments on the NPRM, since they'd just be
> ignored.

Well, he certain was not convinced of so much a benefit from ham radio
that he would go ahead and learn the code. I don't believe we are going
to be capable of doing that without a change of image of what ham radio
is all about. The retention of the code test, however, is a part of the
image of the "OLD Ham Radio". I think people today for the most part are
just not interested in it, or have no concept of what it is. There is no
"NEW Ham Radio" for them to even consider.

Most people seem to think that what us nocoders are trying to do (and some,
I guess, are) is make the costs lower to get in. What I am trying to do is
to make the PERCEIVED benefit match the REAL benefits that you and I know
are here. The modern day benefits that most new people will be interested
in have nothing to do with code. As long as the code is forced upon them,
they will perceive ham radio as being a lesser set of benefits unchanged
much from the 1920's.

If you can come up with a wait to convince people that the benefits of ham
radio far exceed the effort required to get it (code is not that hard) then
I am interested. If you have a means to convince 100,000 new people to go
take a code test to become a ham, I'll withdraw my FCC petition and comments.

I just seems to me that the model changes from Icom/Kenwood/Yaesu and others are coming rather often, and with usually not many new features, particularly in the VHF/UHF rigs, where this often means you can no longer get a matched set of 144/220/440 (if you were so inclined).

Actually only the 6 meter and 2 meter bands have CW-only subbands, therefore
no UHF bands have any. The band plans accomodate this. I don't know if that
is good enough of not.

The exams in general are a big problem. We will get to these problems.
The code problem, which may not even be the biggest, is the most glaring.
The squeeky wheel gets the grease and the code test is screeching loud.

> I stated once before, and I think it bears repeating: There are bigger

There probably are. Let's get the one before us through now, and get on
with fixing the other possibly bigger problems.

> I agree with Phil that all the advertising in the world won't make many
> people buy something they don't want (actually, none will). But it is also
> true that if people really want something, they will work to get it.

If they know they want it. I agree they would work for it. But if the
image of ham radio makes them think they DON'T want it, you have the
problem. I believe CW creates this mis-image.

> I believe that if amateur radio has a problem with piqueing the interest
> of youngsters today, it has little to do with the licensing requirements.
> It has a lot to do with the options they have.

Many of the options are here now. Many more could be made available. But
if the perception of ham radio is still in the 1930's, they just push the
Nintendo cartridge back in.

All doubtless quite true. For those whose situations may be different,
a different opinion: In Yellowstone National Park, the semi-official
geyser-gazer force, whether employed or volunteer, uses standard CB radios
and has a standard channel (30) for reporting eruptions, etc. They're
all scattered throughout the basins on their lonesome because that's
what geyser-gazing is all about - sitting on your bum waiting for
something, and no more than one person need wait for any given thing.

The Ranger force of course uses some Federal frequency and has repeaters
spotted on various mountaintops for coverage. The typical QRM problems
that make CB unusable most places do not typically exist out in places
like Yellowstone, so for those without licenses (which is most people),
CB in situations like this one seems to serve very well indeed.

FCC rules regarding the rulemaking procedures requires that reply comments have a copy "served" (and US mail is apparently adequate) upon the person or entity that filed the comments you are replying to. This is an ordinary practice for all legal proceedings. The only reason you don't have to do this with regular comments is that they are effectively reply's to the FCC's Notice of Proposed RuleMaking, and since you are sending them TO the FCC, that takes care of it.

If you are unfamiliar with how to file reply comments, I strongly urge you to get a copy of, and read, FCC rules part 1 (that's ONE). Many college and university library documents section have the Code of Federal Regulation books. You want "title 47" which contains the FCC rules. The first book has part 1, part 2 (interesting reading: allocation tables), and part 15. The fourth book has parts 73-76 (broadcasting and cable), and the fifth book has parts 80, 94, 95, and something called part 97.

Also check out the Federal Register. It arrives daily. Look in the first few pages where the agencies are listed in alphabetical order. Often the FCC has nothing for some days. When the FCC shows up, you might find the "articles" interesting. While they are mostly legal "mumbo jumbo", they can give you a better idea of how our bureacracy works.

577. CW, Kids, Ham licenses?

Newsgroup: rec.ham-radio
Date: 1990-08-17 10:06:56 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <17.Aug.90.11
Source record: 9088

How to convince people to become hams? Well, I tried recently! My 10-year old nephew showed more than a passing interest in my 2-meter mobile & HT, and the IBM-PC in the corner of the shack.. I explained to him that i was able to send messages from the PC to (almost) anywhere, and gave him a demo of packet. Then i explained to him about having to get a license to use it and the need to pass a test in order to get the license. He seemed to accept this concept without any hangups. I explained the license exam, and said that you had to learn about how radios work and how not to be a nuisance to others by jamming their radios/TVs. Still no hangups from junior op. Then he asked 'Do you know morse code?'. My reply was something along 'Well, I personally dont, but some hams learn it, because those who do are allowed to use different radio bands, which can go a lot further'. He looked puzzled at this, but neither he nor i suffered any further angst on the subject.
He then asked 'how much does it all cost'; i went on to explain that some hams spend pots of money buying expensive radios, but others (like me) get old cab despatch radios and convert them, and that this was much cheaper as well as being quite good fun itself. I told him that my radio cost about 50 pounds sterling. This surprised him. (he had been to a local show at which there had been a ham station with all the latest gear, and had been told by the people there that radios cost thousands of pounds).
<Remember that parents are likely to object to forking out vast sums of money on what they perceive might be a kid's passing phase>
I told him about the license exam and the forthcoming Novice license in the UK, and he wanted more information..... which i have provided.
He was last heard saying 'Hey dad; can i get some packet-radio programs for the Commodore-64?'.
Now somehow I feel that if I had said 'You HAVE to learn Morse because the Government says you do', then his interest would have stopped dead.
Fortunately, the UK and many of the more enlightened countries of Europe have had the benefits of a no-code license for some time.

To paraphrase Pink Floyd:- 'Hello? United States? This is the World calling. Can you hear us?'

>>Your youngster doesn't have to build his radio, just his DSP equipment.
>
>Again, why? Commercial DSP equipment exists, and more is on the way.
>
The old arguement about what level hams should homebrew on. How about this one: Some of my friends who grew up in China say that they had to actually wind their own deflection yolks and flyback transformers when they built their own TV sets. Noone here (USA) ever does that! It would take too long, to figure out the design, and to actually wind. Also, one of my friends says that he built an antenna by using rods of bamboo wrapped with aluminum foil. Because real aluminum rod is hard to find.
At the other extreme: I once saw someone on rec.ham-radio.packet say that he builds packet networks, using store bought radios, TNCs, computers, etc.

Neighter of the above is more valid than the other, it just depends what you want to do, and the resources you have.

I don't know the costs--they probably aren't reasonable--but you can write or FAX the ITU. (I understand their response time isn't too swift.) Their address:

Union Internationale des Telecommunications
Place des Nations
CH-1211 GENEVE 20
Switzerland

[if you want to be strictly correct, put acute accents over the e's in Telecommunications]

FAX: 011-41-22-733-7256

You can find the tables of ITU frequency allocations (with footnotes) along with the US frequency allocations (but not the ITU resolutions, I believe) in a US Government document: "Manual of Regulations and Procedures for Federal Radio Frequency Management," available for $72.00 ($90.00 foreign) from the Superintendent of Documents, Washington, DC 20402.

There is a publication entitled, "Tables of Frequency Allocations and Other Extracts From: Manual of Regulations and Procedures for Federal Radio Frequency Management." (Catchy title, huh?) This document has most of what you probably are looking for. (I keep it handy on my desk.) I don't know what the cost is, if any; in the preface it says: Additonal copies of this book can be obtained by writing to the following address:
Executive Secretary, IRAC
U.S. Department of Commerce, NTIA
Room 1605, HCHB Building
14th and Constitution Ave. N.W.
Washington, DC 20230

I hope that information is useful.

Looks like it's time for another round. For those of you who've lost it, or just never saw it, here's the way to lookup callbook entries over the INTERNET.

+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+

The callbook server is accessed by sending mail to callbook@sat.datapoint.com. Include the following line in the body of your message:

lookup <callsign> [<callsign> ...]

The maximum length of a lookup command line is about 200 characters. You may specify more than one lookup command if needed.

The following commands are also recognized:

path - specify a return address (user@domain or bang!path!user)
help - return this help text.
quit - quit scanning for commands.

Path should not normally be needed, since the mailer should be able to resolve your address. If you do not get a response from the server, you might try including a path command.

Quit is not usually needed either, but may be used if you have a signature that contains things that look like server commands.

Examples:

lookup n5lyt <= About as simple as you can be

lookup n5lyt ns5i ka5pfm <= Look up more than one call

path bob@foo.com <= A bit more complicated example
lookup n5lyt
quit

If you have any questions, send mail to callbook-help@sat.datapoint.com.

De Lee Ziegenhals N5LYT

In article <11128@crdgw1.crd.ge.com> you write:
>1. Reasons for keeping CW.
> a.
> b.
> c.
> d.

Sigh. apperently, I still haven't made my point. I don't want CW abolished;
I just want CW abolished as a requirement for a license. I don't force you
to master current-technology transmissions (i.e. 9600 bauds or higher digital
communications), why do you want to force me to master an ancient
communications method, if I am not interested in that?

That's what the whole thing is about.

582. Gell-Cell charging

Newsgroup: rec.ham-radio
Date: 1990-08-17 17:54:19 UTC
From: Hugh_E._Wells.ElSegundo@XEROX.COM
Message-ID: <900817-105443-7661@Xerox>
Source record: 9092

Charging of Gell-Cell batteries

A Gell-Cell battery should be charged from either a constant voltage source or at a low current value. The Gell-Cell wants to be treated just like a standard lead acid battery in terms of charging and be maintained at a nearly full charge condition for life.

When charging off of a voltage regulated source, adjust the charge voltage to a value just higher than the full charge value of the battery. As the battery reaches full charge, the current will decrease. If desired, the current can be allowed to go to a "zero" value at peak charge.

When charging with a low current value, use a resistor and diode (in case the charge circuit voltage drops below the battery terminal voltage) in series and allow the battery to trickle charge continuously.

The one consideration when continuously trickle charging any lead acid battery beyond a full charge condition, the electrolyte will bubble releasing gas (hydrogen and oxygen). A noticable loss in water content will be observed as a result. It has been observed in a car battery under no load conditions, as an example, that a 100ma continuous charge dissipates water fast enough to require replenishment weekly. The life of a Gell-Cell battery will be shortened under a continuous charge situation where the discharge current never or rarely exceeds the charge current.

The bottom line is that a full charge condition of the battery wants to be maintained, but not "over charged". This is most easily accomplished using a constant voltage source.

>you are using the search mode you only stop on conversations.

There shouldn't be any reason that restoring cellular coverage should
skip over the control channels unless you are only scanning the mobile
frequencies, which isn't all that good of an idea because range is
extremely short. It's easier to scan the base frequencies, plus you
will typically be able to hear both sides of the conversation, although
the mobile may be a bit faint but still readable.

For those of you that are interested, the cellular bandplan looks like
this:

Bases

System A (non-wireline carrier): 870.030-879.990 (bases)
825.030-834.990 (mobiles)

System B (wireline carrier) : 880.020-889.980 (bases)
835.020-844.980 (mobiles)

Channel spacing is 30 KHz. There are additional provisions incorporated
in the bandplan to allow for more growth, but these are the most common
ranges. There are 21 control channels for each of the 2 systems.
The control channels make up the highest 21 frequencies in System A and the
lowest 21 frewquencies in System B of the base frequencies in both cases.
Listening to the control frequencies isn't much fun, but it's a handy way
of determing how many cell sites you are in earshot of. Scan through the
control frequencies and count how many times your scanner stops and you'll
know approximately how many cells you can hear. The reason I use the term
"approxmiately" is that two different cells spaced far enough apart can
use the same control frequency, but you'll only hear it once for obvious
reasons.

If anybody wants any more info on this cellular stuff, drop me a line.

Disclaimer: it's up to you whether or not you want to listen to cellular
calls. I'm just providing information. Personally, I think the ECPA
is a crock. But let's not start on that subject again...

From: MULTI@TRIUMFER.BITNET
Message-ID: <90Aug17.165624edt.57823@ugw.utcs.utoronto.ca>
Source record: 9096

Last night Gary Buchholz was enquiring about my Barker and Williamson AP/10
apartment antenna. I basically described that it consisted of two parts,
a car aeriel which you hung out the window, and a counterpoise that you
draped around the room. Since the car aeriel was electrically short
(52 inches) and did most of the radiating, the results were abysmal.
Did Gary get the message which I sent him?

Y.N. Miles,
VE7-ALQ,
<MULTI@TRIUMFcl.bitnet>

ps: Radiation resistance 3.2 ohms on 15 meters
Radiation resistance 1.4 ohms on 20 meters

> for radio control boats or aircraft? I know there are
> some freqs like 50.1 50.2 etc that we can use. Can
> manufacturers of this equipment be easily found?

Whoa there..... The lower end of six is the province of the DXers.
For example 50.110 and 50.125 are SSB calling frequencies, and CW/SSB is
common up to at least 50.200 +.
If you value the health of your model, you will choose more conventional
model-control frequencies on 6. For example the ARRL Bandplan now talks
about 50.8 -51.0. Traditionally model control has been up in the 53 + region.

I can't suggest specific equipment, sorry.

Bob W3OTC 50 states, 67 countries, 6 continents on SIX

Are there any frequencies in the Bandplan or by common convention for
6 meter packet?

My tnc is far better at waiting for those band openings than I am.

588. Growling interference

Newsgroup: rec.ham-radio
Date: 1990-08-17 23:23:15 UTC
From: garthh@microsoft.UUCP
Message-ID: <56687@microsoft.UUCP>
Source record: 9098

A while ago, there was a discussion on rec.ham-radio regarding a growling interference that sounded like power line noise. The people who were discussing it mentioned it was about 20-30 KHZ wide and occured every 50-60KHZ across the band.

I sympathised quite a bit because I have had similar interference at my location, all across the HF spectrum.

A few days ago it was tracked down to be a touch-lamp (the kind you touch to turn on and off) in a house about 3 blocks away. Once the lamp was unplugged the noise stopped.

Hope this info is useful to other that had the similar noise.

> strength...

Like others have said before, the PRO-34 is very prone to hear cellular
phone transmissions on 800 MHz frequencies outside the cellular phone
band.

However, there's another class of stations in this range that may
sound, at first blush, like cellular phones.

Many SMR trunked repeaters in this band have a telephone
interconnect facility, which lets customers make phone calls.
They sound somewhat like ham radio autopatch on 2 meters
because the mobile cannot talk and hear at the same time.

Both parties stay on the same frequency for the duration of the call.

From: bezenek@plains.NoDak.edu
Message-ID: <5586@plains.NoDak.edu>
Source record: 9097

Has anyone seen an early showing of _Pump Up the Volume_? It is a
movie about a high school student who uses a ham radio to start his
own bootleg radio station. It is due to be released on August 22.

It seems to me that a movie based on radio bootlegging would
generate a negative attitude towards amateur radio. Any comments?

I've seen a book listed in the ads in CQ magazine for a book on "Modifications to Amateur Radio Equipment". It appears to cover many of the mods for current equipment relating to expanding receiver and transmitter coverage of many (most) current radios. The ads state the book is about 200 pages, so it sounds like quite a bit could be covered.

Has anyone purchased this book, and if so, what is their opinion of it?

Source record: 9102

I am another victim of touch lamp RFI which wipes out signals weaker than S9 on 40, 20, and 15 meters. The lamp is located about a block away from my QTH. I borrowed the lamp last weekend and installed a "Pi" line filter consisting of 2 .01 uF capacitors and 2 100 uH chokes. I mounted the filter in the lamp base, in series with the AC line input. Unfortunately, the noise level was only attenuated by about one S-unit. My next experiment will be to install a capacitor directly across the Triac in the controller. Has anyone on the net successfully eliminated touch lamp RFI? By the way, the lamp controller was made in Taiwan, and has no RFI suppression components. A local fake antique shop owner told me that he has sold "hundreds" of these lamps, so this may become a serious RFI problem that needs an urgent solution.

593. IC-24AT Questions

Newsgroup: rec.ham-radio
Date: 1990-08-18 05:16:26 UTC
From: val@swamps.UUCP
Message-ID: <241@swamps.UUCP>
Source record: 9101

I have several questions on IC 24AT operations and capabilities, as
well as on the associated accesories.

* Can the BP-90 (6 - AA cells) be charged with either the wall charger
supplied with the radio, or the BC-72?

* Can the BP-85 (high voltage pack) be charged with either the supplied
wall charger, or is the BC-72 the only way to charge it?

* Does the CP-12 (cigar lighter plug and cord) essentially provide 12 V
to the connector on the cord, or does the CP-12 do some internal regulation?
Also, what kind of connector is on the end? Compatable with the IC 02AT?

* Will the cross-band repeater mode permit simplex to duplex crossbanding,
or is it limited to simplex to simplex?

* Has anyone measured the sensitivity out of band?

* How high will the PLL lock...ie, what's the upper limit for receive?

* Potential ugliness aside, is there an after market adapter which will
adapt battery packs like the BP7 to the IC24?

* Is the BC-35 usable or modifiable for use in recharging the new packs?

* What are the possible ways of recharging a BP-85? BP-90?

* Any other comments on pros, cons, limitations or quirks?

Thanks much.

I've worked 50 countries on Oscar 13. Most of those countries are outside North America. Included are many that are not especially known for high per-capita income... Zaire, Haite, USSR, East Germany, Gabon, India, Czechoslovakia, Romania... By today's standards, my 50 contries is no big deal. Quite a few folks have satellite-DXCC, having worked 100 countries. So... there are people out there, widely distributed around the world, who are active on the satellites.

>Anyway, I guess that technology for technology's sake is a good
>thing, it's just a pity that ordinary hams with ordinary stations
>and income levels have to use the Russian satellites if they
>want to use satellites at all....

Not correct. My first contacts on a satellite (SSB mode on Fuji Oscar 12) were made with the following... Vertical antennas, an old 2m ssb rig that i borrowed, and my HF rig hooked to a 435MHz transverter that i bought at a swapmeet for $150. I agree with your basic concern that radios, preamps, rotors, etc all cost too much, of course. You can buy radios used. That's a very common thing to do. You just don't need all the features of a newfangled $1400 radio! You can get by, at least initially, without az/el rotors. Often, when i'm talking to a DX station, the operator will say, "hold on a minute, i gotta go outside and rotate the antennas!". Satellite antennas can be mounted near the ground, so you can literally just push 'em around by hand. Satellites such as Oscar-13, in molniya type orbits don't move very much during the "good" part of the orbit, so you don't have to do this very often. Some of the microsats are loud enough that you can use a simple vertical antenna with no rotator of any kind. Finally, the last expensive components... the antennas. Many foreign operators build their own. The various ARRL books are full of fairly complete plans. I'm not very good at mechanical construction, so I bought antennas, but i talk to lots of people who've built their own satellite antennas for 145 MHz & 435 MHz.

If you thought it took several thousand dollars to get on the satellites then i hope i've shattered that myth for you. If, on the other hand, you know how to build satellites that are easier to use, then by all means share your ideas. AMSAT (remember, it's a volunteer organization) needs you!

>What're the odds that the first ever geosynchronous AMSAT will need
>oodles of bucks for the "who cares, it's a neat technical hack!"
>esoteric up and downlinks....?
>
The odds are zero. The AMSAT Phase-IV project (study of possible geostationary satellite design) included a number of concepts to reduce the cost of a basic ground station. For example, because it's geostationary, you wouldn't need rotors. Because it was going to use higher powered transmitters, you woudn't need as sensitive a receiver on the ground, etc. Meanwhile, Phase-IV has been shelved because it was deemed to ambitious a project. Too costly to design and build.

Wait! The Russian satellites are too expensive for me to use. I'd
have to buy a HF rig and antenna to go along with my 2m,430,1269,
and 2304 gear. :-) (Ok I DID just buy an HF rig, but then I'm
a glutton for punishment.)

Seriously, the Microsats were designed to be used with relatively
simple ground equipment. You don't have to have steerable antennas
or high power. I used an IC211 and an IC402 bought at a hamfest for
$100. After lightning blasted my station a while back, I did buy
an expensive Kenwood 790A, but I'm not really happy with it. If
anyone has an IC202 they'd like to part with, I'm interested.
Antennas are simple homebrew J poles.

Oscars 10 and 13 do require steerable antennas and more power to use effectively. I added a Mirage D1010N to my IC451 and used the late lamented IC211 for receive. The antennas have evolved through a series of commercial and homebrew models. They all worked to varying degrees. Currently, I am using the high priced spread, KLM, but cheaper antennas do work. I was sucessful with homebrew helices wound from copper tubing over a PVC frame, mounted on a ground level Radio Shack tripod and steered by hand. If you can make 50 watts of RF on 435 (even an old Motorola dynamotor rig will do this if you can stand the noise) and if you can receive 2 meter sideband (say a converter to a HF receiver), then you should be able to work 10 or 13. CW only of course. Yes pro-coders, this no-coder can use the beep beep stuff too. :-) :-)

A state-of-the-art all mode all band satellite station can cost a mint, but you can use the satellites for a whole lot less. You can certainly work a Microsat or Oscar 13 for less than the cost of a HF rig even if you start from scratch. I guess it all depends on your priorities, if you simply must be on the DXCC honor roll, then you won't have the funds to work satellites. But, if VHF-UHF is your thing, you probably already have enough equipment to work the birds.

>
I got chance to pop by The Shack last night and grab the LM386 they sell.
It is in fact a LM386-1 - the exact same thing that is already in the
PRO-34. But since I was in that 'modify mode' I decided to change the
2.2uF cap that is between pins 1 & 8 to a 10uF - in stock condition I
measured .096 volts DC on the earphone jack with an earphone connected,
volume at max and squelch fully open - after the cap change under the
same conditions (even the same channel and frequency) it showed .102
Not a big difference at all, so next time im in at the local supply
house I will be getting a LM386-3 to see how much audio I can get out
of this puppy.

As for battery life, to my thinking if you do not exceed the same audio
level of an unmodified radio - the battery life should be the same. This
is in my case 90% of the time. There is however that 10% where having a
bit extra headroom (audio power) would be a big plus ;-)

| nor will I try. What's missing, though, and what started this whole mess, is
| some justification for *requiring a test of CW proficiency* in order to become
| a licensed amateur. That fact that CW is a useful technique under certain
| conditions does NOT, at least in my opinion, constitute such justification.
+---------------

My complaint exactly.

Novices can work packet on 220MHz and even can run digipeaters. So why
isn't packet covered on the Novice theory test? Why isn't there another
separate test on packet --- or, more precisely, why *is* there a test on CW
but not on packet?

It seems to me that CW's "exalted" position must be justified. It's not as if
we must use CW to worship the Great God of Electromagnetism, after all.

>I just want CW abolished as a requirement for a license.

Yes, but a case could be made that the greater percentage who learn CW before getting their license, the greater percentage who will use CW as an operating mode afterwards. Do you want to effect a change in the proportion of amateurs who operate CW?

In past years, the FCC probably considered it very useful to have operators who were trained to pick up CW maritime distress signals and such. Requiring CW for the amateur license created a body of such people for almost free. With satellite locators and such, I don't see as great a need to such operators anymore. But I see this as a bad thing for amateur radio, since the lower the perceived public benefit, the less government support we will probably get for our frequencies and privileges.

I haven't made up my mind on No-Code licensing yet. I don't think it will solve any of the "problems" in amateur radio, but it will change the nature of the hobby.

>on self-policing. ...

I'm no psychologist, but I can read psychology textbooks. Much
experimental evidence exists that correlates the perceived effort a
person has to expend to obtain something, with how highly they value
that something after obtaining it.

Passing a written test alone requires much less effort than a written
test plus an operating skill test. Should the goal be to make it easier
to get into amateur radio, or to encourage leading edge technical skills
over traditional operating skills? Would a more difficult written test
that requires as much study time, on average, as it takes to learn code
at 5 WPM be appropriate?

I value the very polite style of operating usually found in most amateur
bands. The percentage of poor operators is significantly higher on CB.
I've heard obscenities a few times on SSB and 2M, never in the novice CW
subbands, and in well over 20% of CB transmissions I've monitored. IMHO a
no-code license will somewhat increase the percentage of poor operators
on the amateur bands. However, I don't know whether this "cost" will or
will not outweigh the benefits of getting more good technical people
involved in amateur radio.

601. IC-24AT receive images

Newsgroup: rec.ham-radio
Date: 1990-08-18 18:12:17 UTC
From: nicholso@hpcuha.HP.COM
Message-ID: <22480013@hpcuha.HP.COM>
Source record: 9114

I found several apparent images in an Icom 24AT with the receive capabilities opened up.

Displayed Received same as: difference

85.645 147.385 (61.74)
85.310 147.060 (61.75)
88.00 TV channel 36 audio
149.745 TV channel 36 audio
201.250 146.940 (54.31)
201.500 147.060 (54.44)
206.875 TV channel 36 audio

What frequency is channel 36 audio supposed to be transmitted on? Could I have picked up a some sort of remote feed?

Other frequencies tested:

Air band: The Icom was not as sensitive as a Sony Air-8 air-band receiver, but still picked up several control towers and aircraft out to about a 20+ mile radius. An attic mounted discone was used for both radios for this comparison.

Middle of the 800 MHz range: the expected signals, about a dozen cells could be heard.

In the FM broadcast band I could hear a few strong local stations (106.5 MHz comes to mind), but only when very quiet music passages were being playing.

BTW using the rubber duck antenna that comes with the 24AT is like transmitting into an attenuator. I get signal reports up to 3 S-units higher with either a 19" metal whip or a Yeasu dual band rubber duck.

bezenek@plains.NoDak.edu (Todd M. Bezenek KO0N) writes:

> It seems to me that a movie based on radio bootlegging would
>generate a negative attitude towards amateur radio. Any comments?

How about a movie where the old ham can't wait for the national emergency
so his pitiful station can save the day (Red Dawn)?

I am a ham and an ex-pirate, and I already have a negative attitude toward
amateur radio. It seems no one can ask a technical question in this
newsgroup (much less on the air) without getting a political answer:

Q: can I boost the power of my 49mc walkie talkie
A: THAT'S ILLEGAL. GO CRAWL INTO A HOLE.

I have a lot of equipment that I could use to break the law, some of which
is ham gear, then there's my gun, my automobile.... I modified my IC 02-AT
to get police channels? Anybody want to know why? Of course not.
You're all sure I'm out there harassing the cops and I should be fined
etc.

I did it because I worked in a two way shop, repairing radios FOR the
police, and it was a very handy diagnostic tool.

Besides, suppose I just like to build radio circuits? My friend built a
60W AM broadcast transmitter just to see if he could do it. He has no
equipment that works on 160, and no interest in talking to hams, but he
built his circuit and he tested it with a dummy load. One time, the AM
broadcaster he works for had an emergency, and his little tube-type
transmitter kept them on the air! It was REALLY EXCITING.

Now I suppose I'll get flamed because my friend's transmitter would not
meet FCC specifications for AM broadcasting.

So who is the real "radio amateur"? The guy who build circuits to learn
about radio, or the guy who times out repeaters complaining that the
device could be used for illegal purposes, and denying assistence they
are probably not capable of providing anyhow?

You tell me --- who are the real "radio amateurs"?

When people ask me if I'm a ham, I say no, I just have a license.

David
I wish I were proud of N5IZU

go ahead you old folks, dive for your callbooks and make sure I'm real!

603. ungrounded station questions

What is recommended for HF transmitting when a ground isn't available?
Example situations: multi story apartments, hotel rooms, roof top
stations, mountain top portable stations, or air mobile (aircraft
operators permission, of course :-).

Do balanced antennas, balanced feedlines, or various matching networks
help keep RF off the radio case? Are counterpoises effective and do
they radiate?

Also, how can base fed vertical antennas without an earth ground be
decoupled from the feedline?

Thanks,

604. TV and Cordless Phones

Newsgroup: rec.ham-radio
Date: 1990-08-18 20:55:00 UTC
From: lwrclmr@SACEMNET.AF.MIL
Message-ID: <9008190236.AA22820@ucsd.edu>
Source record: 9116

A recent posting mentioned a bill being run through California regarding the monitoring of cordless phones. The author stated that allscanners, sw receivers and UHF TELEVISIONS TUNING THROUGH CHANNEL 83 can receive cordless phones. Can someone please explain this to me???

Last I checked, the old cordless phone operated on 1.7/49 MHz and the new ones are on 46/49MHz. Now I'm not sure exactly where the UHF channels are all at, however I do know it starts up around 470 MHz or so and channel 2, which is the lowest TV channel I know of starts at about 56 MHz and they all go up from there. SO how do you get cordless phones on UHF TV?? Is there a new set of frequencies for cordless phones?? I know I'm not always on top of new developments, so PLEASE fill me in. Inquiring minds and all that.

Thanks
73,
Michael

How would YOU feel if someone required that you learn some other method of
communication in order to earn the privilege of communicating in Morse Code
on the Amateur spectrum?

> Here are the issues of interest to me and my comments:
>
> 1. Reasons for keeping CW.

Tell me... when you say "...keeping CW" do you mean:
1. Keep CW as one of the modes hams may use
2. Keep the CW exam as a requirement for any amateur privilege

You did NOT say "exam". To me that means you probably meant #1, but
maybe I am wrong and you meant #2. I do suspect many people will think
that you meant #2 so maybe you could clarify.

> a. Its relatively small bandwidth makes good use of the limited
> amateur spectrum, thus enabling many QSOs to take place over
> a given frequency range. This feature is something that will
> become increasingly a factor in the near future as demands are
> made not only from within amateur radio but from without for
> more frequency spectrum.

CW does have a relatively small bandwidth. This is partly because it also
has a slow "data rate". Voice, however, while having a very high data rate
and also a very high data per bandwidth rate, suffers from the fact that
most of the data itself is useless. This is not a comment on what we hear
on the frequencies, but rather a description of the characteristic of the
human voice. Arguments can also be made about WHAT is said with voice.
So one possible reason to use CW is:

There is less opportunity, and fewer operators, "jawing off" in CW.

> b. A message has a better chance of getting through under
> conditions of weak signal, interference, or noise.

CW's ability to get through noise is NOT because it has a narrow bandwidth,
but actually because it has a WIDER bandwidth. We just think the reason is
the narrow bandwidth because we generally see CW as narrow and packet or RTTY
(and other modes) as wider. The ability for ANY signal to overcome noise is

strictly a function of its level of redundancy. Redundancy can take many forms. FM is redundant because the information is sent in many sidebands. CW is redundant because the carrier remains on for relatively lengthy time periods. Even raising the power is a real form of redundancy. When QRO can only barely get through, QRP will be unable to.

Slow packet down to the same rate, and it will be able to as well. But is this an efficient use of the spectrum if the number of messages you can get through is very low? Think in terms of "words per minute per bandwidth per watts". Bandwidth is "cycles per second" so you have two time components that cancel out. Now you have "words per cycle per watts".

Given extreme conditions, such as a ship beached on an unknown island in the south pacific in the middle of a storm, CW might be able to make it through when other modes might not. The reason for this is the fact that it is a SLOW mode. When conditions get tough for even CW, don't you find yourself going QRS?

> c. International communication is straightforward and simple with
> predefined Q signals and other accepted amateur abbreviations.

You can, and I do, use these Q signals in voice. CW does not have any exclusivity to abbreviations.

> d. Its simplicity enables any amateur, who is assumed to have
> a fundamental knowledge of the art and science of radio
> communication, to signal in the event of emergency when this
> most basic form of communication is required. The most
> appropriate instances are when one is isolated during an
> accident or natural unnatural disaster and other means of
> communication either do not work for reasons of equipment
> failure or because of inadequate signal levels at the receiver.

Unfortunately, we hams are losing this knowledge of the art and science.

> e. CW is a skill that is achieved through the expense of effort.
> My personal belief is that something is appreciated more
> if one works toward a goal and achieves it as a result of his
> own ability and work. Something has little value if it is given
> outright with no corresponding expense of energy on the part
> of the recipient. In the present case, that something is
> the privilege to operate an amateur radio station.

I believe quite differently than you do. My belief system is based on a simple economic model. For anything I might get, it costs me something to get it, and it benefits me in some way. While I usually do not actually quantify my individual decisions, I do think of them in that way.

When I choose to buy something in a store, I think in terms of the cost to me to buy it (which is MORE than just money... it includes the need I have for my pocket money for food if I am hungry, the effort to carry it home, etc.) vs. the benefits I will receive from it. If I believe the benefits will exceed the costs, I will buy it. I might have wrong information and

in fact have many times bought things that turned out to have less benefit than their cost. I then decided to sell them because the benefit of keeping them was less than the benefit of the money I could get by selling them.

I decided to get into ham radio because the perceived benefit exceeded the perceived costs. I have understood correctly what ham radio was for many years. The perceived benefits were accurately understood. The costs, on the other hand, changed. I perceived the costs to be high because I was running into poor methods of teaching code. I finally found a ham radio class the was teaching the code in such a way that it was easy for me. The Morse Code turned out to be quite easy (as was the written exam, but I knew that already).

So in fact I got into ham radio because for me it became EASY to do relative to the benefits. I will remain active as a ham as long as the benefits of ham radio exceed the benefits of spending my time doing something else.

To bring my point to its zenith, my appreciation of ham radio is strictly based on the BENEFITS it gives me, and absolutely unrelated to the work involved in getting into it. That work, what little there was, is past me now and I cannot recover it.

There are two parts to this. Your history lesson is probably accurate. Then you switch to something about proficiency levels. Are you meaning just proficiency levels in operating Morse Code? What about setting goals for proficiency levels on other areas? There are many of them, of course.

> g. CW permits one to have a conversation with another at a speed
> which is comfortable to the operator, and as a result, permits
> the operator to organize his thoughts so that a coherent and
> continuous exchange can take place. That is, there can be
> less pauses than are found in voice communication.

The pauses often heard in voice communication take place primarily in long winded transmissions. Keep your transmissions short and you won't have these problems.

I have found them to be this way as well. I have also found other dealers to be this way.

I believe most of the posters here, as well as most hams, have the best
interests of ham radio in their mind. However the differences are most
likey a result of the basic differences as individuals.

> I have had many QSOs in my amateur radio experience, and from this

Now if we can only agree upon just what those fundamental principles are.
I suspect we never will. The "we" is the whole of the ham population.

> P. S. If anyone would like to discuss any of the topics further with

> spend most of my time listening for DX so you may not hear me.
> Call me on frequency or make a sked through email or better yet,
> send me a message through the National Traffic System the old CW
> way.

It looks like we are sufficiently different in operating that we probably
won't communicate by ham radio very soon. I primarily use the VHF and UHF

bands using voice modes, and expect to be going into packet radio and ATV soon. I do notice most of the above frequencies are in the Extra class only subbands. Is this intentional? I would respect your desire to limit your operation to others who have higher speed code skills, as the slower code speeds can quickly get boring. Not much gets said when you can only say 5 words every minute. I would like to make the suggestion that you find time sometimes to visit the Novice subbands, and help someone with practice in their code. You would have to tolerate their slow and poor code, but I suspect you are good operator and they could use some good examples, as well as the practice.

607. Re: New License Classes

Newsgroup: rec.ham-radio
Date: 1990-08-18 23:51:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500690@ux1.cso.uiuc.edu>
Source record: 9119

Since we are tossing out ideas of license class structures, I'll toss
out mine as well:
. . . . .
VHF / UHF track HF / code track

| |
| |
V V

COMMUNICATOR NOVICE <---- beginner /
basic written exam basic written exam entry level
. HF written element
. 5 WPM CW exam
limited privs > 50 Mhz COMM+ limited HF privs

TECHNICIAN GENERAL
advanced written exam advanced written exam <---- primary
. HF written element classes
. 5 WPM CW exam
all privs > 50 Mhz TECH+ most HF privs

The upgrade paths are:

start
|
V
COMMUNICATOR ---> NOVICE
| |
| |
V V
TECHNICIAN ----> GENERAL
|
|
V
???

There is no path from Novice to Tech in this scheme because if you can pass
the combination of exam elements for Novice and Tech you have passed all the
ones for General. You can of course skip any number of steps you want to
from the starting point.

More privilege details:

Novice:
current novice privs at 200 watts max.
plus:
Communicator:

25-50 watts max on VHF/UHF
5-10 watts max on SHF/EHF
Not control op of repeater/beacon/auxiliary

The "???" is a place where you can still have Advanced and Extra classes.
Many hams now holding these would not want to see the system too radically
simplified.

RTTY DX Notes 1of3 8/17/90

RTTY DX Notes for weekending 17th August 1990
BID: $RTDX0817
Part 1 of 3.

With the problems in the Middle East, one could be expected to assume that communications with that area would be closed off, but such does not appear to be the case. Several stations have been noted passing traffic (from both sides of the fence). It just goes to show that you cannot always trust these amateurs. Some of the information has been good and some bad, as one would expect under the circumstances.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT, UT5RP, W2JGR, W0LKS and the Tri-State DX Association VHF packet cluster, and to those not named who also sent some interesting news.

Message-ID: <1615@n8emr.UUCP>
Source record: 9126

SB RTTYDX @ RTTYDX $RTDX0819
RTTY DX Notes 3of3 8/17/90

RTTY DX Notes for weekending 17th August 1990
BID: $RTDX0819
Part 3 of 3.

QSL Information.

V51P will QSL via Box 9080, Windhoek, Namibia.

TU2BB has QSL manager of N2HOS.

9Y4SF has WA4JTG as his manager.

ZD9BV says to send his cards to W4FRU.

TL8TM says that F6FNU will do his QSL work for him.

FP5DX collects his cards from Box F-97500, St Piere et Miquelion, Via France.

7S4RY will QSL via SM4CMG.

RV4F/RT4UY says that his QSL address is Box 73 Kiev, 2522909 USSR. That postal code looks odd, but that is what he was sending, though I did see one report that says it is 252209. But the station was sending the original number.

JW7SP says to QSL via LA3T.

Notes of Interest.

The station listed as 9K2?? was deliberate to prevent any repercussions. Some mail is drifting out.

7S4RY is a special call celebrating the 20th anniversary of the SARTG RTTY Contest.

ZD9BV has been fairly active with a weak signal, which he hopes to improve when he has finished building his house and his new beam.

JA2NQD and JH1BNL will operate from Belau and Yap from September 13th to 19th. QSL to their home calls.

JG1NBD will operate from S79 Seychelles, September 13th to 17th.
JH1QDB will operate from Ogasawara (JD1) from September 23rd to 30th.

There seems to be a rumor around that there will be activity from TI9 from the 19th to the 24th of this month. But nothing has been heard

on a solid basis as yet. Keep looking, it may happen.

GL DE DX1.

> It has been said that the reason for making a no code license
> is to attract high quality (tech) people into the hobby. I think it
> will have exactly the opposite effect. One of the things that has kept
> the hobby in reasonably good shape has been that the people who work
> for their ticket, ie. learn code, are more likely to be self policing
> than someone who is given a ticket. (Yes, GIVEN! I don't care how many
> technical questions you put on a test, any moron can memorize a question
> pool) Usually people who are "challenged" by a problem, like learning
> CW, and WORK to overcome (solve) that problem, carry that philosophy in
> life. It's those people, the ones who enjoy a good "challenge", like
> dealing with packet throughput or refining DSP or spread spectrum,
> are the people that we NEED in this hobby. (did Marconi know CW?)

First of all, let's get something straight here once and for all:

Learning Morse Code is, for the vast majority, EASY!

Morse is NOT a challenge, for the most part it is just hazing.

So what value is there in the "work" involved in it? It took me a
grand total of 6 hours of study time to learn Morse Code. Does that
make me feel my license is somehow more valuable? DEFINITELY NOT!
In fact, the continued existance of the Morse Code requirement makes
my license seem LESS valuable.

We hear this argument quite often. This is the one about the "work"
ethic and such. Perhaps some people do value someone based on how much
it costs to get. I don't. I value something on what I continue to get
out of it.

> But it's too late now. We ran our big mouth and said we wanted
> a no-code license. The FCC is going to give us one like-it-or-not.
> They have been pressured on this subject for years. Now that "we" have
> expressed a desire to have a codless license, we'll get one.

Good! It's about time. I'm relieved to know all this effort has
paid off. Maybe I might even VALUE IT for all the WORK I put in it :-)

> A couple of things may have been overlooked (or have long
> since died) that concern me:
> The FCC stated that they would not implement an additional
> class of license. It would require resources that they don't have.
> So, we opened our big mouths again and said that four-letter word
> "restructure". Ohhhh noooooooooooooooo!

They have the capacity for 6 classes because the present computer system
was put together under the impression of an impending Communicator class

in a prior proposal.

> The FCC also said that they would not issue calls that labeled
> these VHF/UHF codeless newcomers as codeless newcomers. It would
> require re-programming, effort, willingness, or something like that.
> Again, resources that they don't have. Now I guess we will have a large
> pool of codeless VHF/UHF apliance operators who have calls that are no
> different from the guys on HF. hmmm howz anybody gonna know??

How do you know NOW?? I am KA9WGN, and without looking it up you just
cannot tell. Am I a Novice? Tech? Advanced? You tell me.

> <(Yo fellow pessimists! add your snow-ball effects here...)>

You are now revealed1

> My only hope is, now that the inevitable is bound to happen,
> that we contact, elmer, befriend, encourage, and twist arms with these
> newcomers and get them to love and repsect their new privelege as most
> of us do. If we subject them to hazing or treat them as anything other
> than "fellow amateurs" (awwww, do I have to??) then they will have no
> more respect for the hobby than the folks on 11 meters (or 20 or 80).

If you convince them of the benefits they can enjoy with their license,
maybe they will respect it.

> My problem now is that I still get nervous as a novice when I
> operate CW. I have got to get over my fear of working CW before the
> no-coders come.

If you operate HF, you won't see much difference. The "no-coders"
may be coming, but they are coming to at least above 30 Mhz and maybe
even above 220 Mhz. So if you are into code on HF, you won't see much
effect from "no code" except maybe a slight reduction on the overcrowding
down there.

> that something after obtaining it.

But as much evidence exists to the contrary as well. In particular this
characteristic differs from one individual to the next.

> Passing a written test alone requires much less effort than a written
> test plus an operating skill test. Should the goal be to make it easier
> to get into amateur radio, or to encourage leading edge technical skills
> over traditional operating skills? Would a more difficult written test
> that requires as much study time, on average, as it takes to learn code
> at 5 WPM be appropriate?

Again, things differ between individuals. Some people find the code test
harder, some find the written test harder, some find both easy, and some
find both hard.

A more difficult test for the sake of being more difficult is out of place.
Such a test serves no purpose but to haze people. The test to earn the
privilege of being a ham radio operator should test for what knowledge and
skills are required to be able to share a radio spectrum. It doesn't need
to be intentionally hard. Some will find it hard and some will find it easy
no matter what you come up with.

> I value the very polite style of operating usually found in most amateur
> bands. The percentage of poor operators is significantly higher on CB.
> I've heard obscenities a few times on SSB and 2M, never in the novice CW

> will not outweigh the benefits of getting more good technical people
> involved in amateur radio.

CW as an operating mode tends to discourage bad operating practices.
It's time we thrust off that crutch and start to "heal" the Amateur Radio
service directly. Sure, there are some bad operators, but this problem
can be dealt with. But it is by no means at the crisis level either.

Message copied from WB2K who got it from W2JGR.

The following message was copied Sunday evening 8/12
by W2JGR from an amateur station in the Middle East.

SUBJECT: NEWS REPORT FROM KUWAIT
DATE REC'D: 12/8/0908Z
TO: ALL
FROM: KUWAIT

THANKS FOR THE RELAY THE MESSAGES...AND HERE IS A SMALL REPORT
FROM MY SELF YOU MAY TAKE AWAY MY NAME AND CALLSIGN ETC
YOU MAY SEND TOTHE W.P OR TO ANY DESTINATION YOU FIND IT GOOD.

IRAQIS AND SINCE MANY DAYS ARE COMING INTO KUWAIT AS
GROUPS OF HUNDREDS, AND THOUSANDS... THERE IS NO BORDER AND
THEY ARE NOW OVER 100 THOUSAND OR MAYBE MORE INTERING KUWAIT.
SOME OF THEM WITH BUSSES, AND OTHERS WITH CARS, BUSSES, AND LORRIES.

THEY TAKE EVERYTHING FROM THE SHOPS AND SHOPPING-CENTERS AND FILL INTO
THE LORRIES AND GO BACK TO IRAQ. THEY BREAK EVERY SHOPE...ALL THE CARS
IN THE WAREHOUSES OF THE BIG COMPANIES, SUCH AS NISSAN, TOYOTA, ALL
JAPANESE, MERCEDEZ, GENERAL MOTORS ETC ETC... ALL ARE BEEING TAKEN AWAY
TO IRAQ.. AND WHATEVER THEY CANNOT TAKE THEY BURN OR DAMAGE. THEY TAKE
ALL THE PARTS... SPARES PARTS ACCESSORIES, AND WHATEVER WAS IN THE
NATIONAL , TOSHIBA, MITSUBISHI, PHILLIPS ETC ETC BREAKING THE SHOWROOMS
AND TAKING EVERY SINGLE AWAY. IT IS A COMPLETE CHAOS.... WE NOTHING
TO DEFEND OURSELVES... WE HAVE NO WEAPONS TO DEFEND OUR HOUSES AND
CHILDREN AND THERE IS NO POLICE NO ARM ... NOTHING TO BRING SOMETHING
INTO CONTROL...IT IS AN ABSOLUTE QUIET-CHAOS IT IS A QUIET-CHAOS ..
BECAUSE THERE IS NO RESIST... NO BODY CAN RESIST... AND THEY JUST COME
AND TAKE WHATEVER THEY LIKE .... ALL THE FOOD STORES... BEEN
STOLLEN....THEIR PUBLIC ARMIES (PUBLIC ARMY.... THEY CALL IT EL-JAYSH
EL-SHAABI) HUNDRED THOUSAND OF THEM...FULLY ARMED WITH GUNS ANIT IS A
VERY SAD SITUATION FURTHER MORE....SOME PEOPLE OF INSIDE KUWAIT .. BAD
PEOPLE TAKE THE OPPORTUNITY TO WHATEVER HE LIKES... STEELING AND
TAKING CARS BURNING ETC ETC... NO CONTROL NOBODY CAN TELL THEM
ANYTHING... BECAUSE EVERYBODY WILL THINK THAT DAMAGES BEEN DONE BY
IRAQIS ... AN IT IS NOT TRUE... THERE ARE MORE DAMAGE FROM PEOPLE

INSIDE....FOR I AS I SAID THERE IS NO RULE NO GOVERNMENT NOTHING TO
DEFENT THE PEOPLE OF KUWAIT INSIDE. FOOD AND ACCOMMODATIONS...NOW IN
QUEUE YOU HAVE TO STAND IN LONG QUEUES IN FOUR LINES... 2 FOR MEN
ANOTHER 2 FOR WOMEN.. AND FOR A BUT THE SUPERMARKETS DO NOT SELL
MORE THAN 10 KD FOR EACH FAMILY IN A DAY... THE FAMILIES HAVE NO CASH
MONEY, THEY CAN OFFER THEIR CREDIT CARDS OR THE BANK-ACCOUNT-NUMBERS ,
AND CAN TAKE ABOUT 10 KDAND DISTRIBUTED IN THE SUPERMARKETS FOR PEOPLE
TO READ.. BUT ALL THE KUWAITIS...JUST SPITTING ON THOSE PAPERS AND
SQUEEZING THEM BY THEIR FEET... NOBODY LIKES TO READ ANYTHING ABOUT ALL
WHAT IS WRITEN I DID NOT TRY TO TAKE ONE THEY CALL THE
MUBARAK-ALKABEER HOSPITAL THEY GAVE IT THE NAME SORRY I FORGOT THE
NAME NOW HI.. BUT CHANGING NAMES ANYWAY... E.O.F.
GA LOGOFF 73'S JULES DE XXX YYYYY
DURATION: 15 MINS.

I thought that that might be interesting to read. To the best of my
typing ability, that is an exact replica of the message that I
received. By the way, KD is the Kuwaiti currency.

In article <9008190236.AA22820@ucsd.edu> lwrclmr@SACEMNET.AF.MIL ("LWRCLMR") writes:
>A recent posting mentioned a bill being run through California regarding the
>monitoring of cordless phones. The author stated that allscanners, sw
>receivers and UHF TELEVISIONS TUNING THROUGH CHANNEL 83 can receive cordless
>phones. Can someone please explain this to me???

Somebody's mixing apples and oranges here.

Some shortwave radios can tune to the 1700 KHz band where the older cordless
phones can be found, but "shortwave" receivers can't receive the VHF 46/49 MHz
bands where most cordless phones operate, so they are of limited use.

Most scanners can be used on the VHF cordless phone frequencies. This is
true.

UHF TV's capable of tuning up to channel 83 have no use in receiving
cordless phone conversations. However, they can be used with limited
success in listening to CELLULAR phones, which are in the 800 MHz band
(870.03-889.98 for cellular base frequencies). Modern digital TV sets
wouldn't work, but older ones with a fine-tuning control may work.
I haven't tried this myself.

Here are the cordless phone frequencies, if anybody needs them.

Channel Base Handset
1 46.61 49.67
2 46.63 49.845
3 46.67 49.86
4 46.71 49.77
5 46.73 49.875
6 46.77 49.83
7 46.83 49.89
8 46.87 49.93
9 46.93 49.99
10 46.97 49.97

49.83 is also commonly used for room monitors (aka baby monitors).

>Thanks
>73,
>Michael
>WA7SKG

You're welcome.

615. IC-24AT Questions

Newsgroup: rec.ham-radio
Date: 1990-08-19 05:56:15 UTC
From: faunt@CISCO.COM
Message-ID: <9008190556.AA27084@ucsd.edu>
Source record: 9123

The BP-90 as supplied cannot be recharged, as far as I can tell. There's an adapter called an AD-14 that allows you to use the BP90 in the BC-72, but what it's function is I've not been able to find out. I called ICOM technical support, couldn't remember the adapter number at that time, and the person knew nothing about any such item. I'll call again with the number AD-14 in hand and see what they say.

The BC-74, which is what I think comes with the 24AT will charge the BP-85. The CP-12 does no internal regulation. There's also a OPC-254 which is a DC power cord without the filter, cigarette lighter plug, but has two fuses, and is $4.50. It's a very small coaxial power plug, and I don't believe it's compatible with the 02AT since it's not the same as my IC32AT.

The BC35 cannot be used to charge the S series batteries to my knowledge, however the BC72 can run with 13.8VDC input.

The BP-85 can be charged by the BC-72, BC-74, CP-12, or the OPC-254, according to the manual.

The above information is from having an R1 in my hand which uses the same batteries, etc. as the IC24.

616. No-code brings in hams!

Newsgroup: rec.ham-radio
Date: 1990-08-19 08:41:28 UTC
From: luru@stekt.oulu.fi
Message-ID: <LURU.90Aug19114540@stekt.oulu.fi>
Source record: 9029

After the announcement of a new radio amateur licensing class in last December (Communicator class, 432 MHz only, all modes, no code test required), the number of new hams in Finland really boosted.

In our little Radio Amateur League of 5,000 members, a rush-in of 500 new faces (and voices, of course) compared to the previous growth of around 50 is really good news. Imagine ARRL growing 10 % in 6 months! There are about 5 million inhabitants in Finland.

Our age profile is not as much inclined to "old farts" as in ARRL, but definitely there is room for improvement. These new hams are mostly young and fresh power. There is a possibility to upgrade to "Basic class" (HF CW except 14 MHz & WARC bands, phone on 28 MHz; all modes on 144 MHz, 432 MHz) by taking the CW test only. Other than that, the exams are identical.

I don't work for the League, so I don't have exact figures. If you are interested, write for more information:

SRAL
box 44
00441 HELSINKI

Go no-code now!

By the way, I am a keen CW operator myself, when not busy teaching on a novice course..

In northern Virginia where I used to live, there was a large
discount store (Sam's) right under one of Bell Atlantic's
cell sites. After ECPA passed, I took great delight in going through
the television department and playing with the UHF tuners on
all the little tiny cheap TVs (all of which had analog UHF tuners),
retuning them to output the Cellphone traffic, much to the
dismay of passers-by. One of them even asked me if that was
cellular telephone and I told them "yes." He said he thought
is was "private" and I asked him how he could possibly believe that
BS if every TV set in Sam's discount store could recieve it.
He decided that in the future he would be much more circumspect
about what he said on his cellphone.

Oh well, one at a time, I guess....

A point that should not be lost either is that writing software is a perfectly valid form of homebrewing. The same people who might have been building their own vacuum tubes, capacitors, etc yesterday are probably writing software today. Nowhere is this more true than packet radio - it will be software that makes packet radio valuable to its users, not hardware. And, speaking from the standpoint of having built a commercial hardware/software networking package, the hardware is the easy part. Note that I am not attempting to start a hardware/software jock flame war - I play both fields, and certainly the world needs both specialties.

From: gary@ke4zv.UUCP
Message-ID: <1272@ke4zv.UUCP>
Source record: 9033

At the risk of starting another flame war, here are some practical
suggestions.

In article <22480014@hpcuha.HP.COM> nicholso@hpcuha.HP.COM (Ron Nicholson) writes:
>What is recommended for HF transmitting when a ground isn't available?
>Example situations: multi story apartments, hotel rooms, roof top
>stations, mountain top portable stations, or air mobile (aircraft
>operators permission, of course :-).

Any antenna that doesn't require a "ground mirror" should work reasonably
well. This means an antenna that is an electrical half wavelength or a
multiple of a half wavelength. Almost anything that is a reasonable
fraction of a wavelength or bigger in size will radiate to one degree
or another and non-resonant antennas have been used for years, but in
general the simplest antennas are an electrical half wavelength.

>Do balanced antennas, balanced feedlines, or various matching networks
>help keep RF off the radio case? Are counterpoises effective and do
>they radiate?

Balanced feeders and balanced antennas should keep RF off the radio,
but I have seen cases where this was not true. Generally in those
cases just changing the feedline length solved the problem. End feeding
a half wavelength antenna requires a high exciting voltage since you
are at a high impedance point, center feeding a half wavelength requires
high currents since you are at a low impedance point. When you use a
feedline, it's length will transform this impedance as seen at the
source to something else. Thus you could have high RF voltages at
the transmitter from a center fed antenna or high currents at the
transmitter from an end fed antenna. Generally, having high voltages
at the transmitter is the nastiest case from a "hot chassis" point
of view. In theory a perfect match to the line prevents these problems,
but in practice, you are unlikely to get a perfect match across the
band.

A counterpoise can be effective and it can radiate, this is one of
those "it depends" questions. So much depends on the installation
and physical surroundings that a general theoretical answer just
won't do. You must cut and try, measure and experiment to get
a working system. A half wavelength counterpoise directly connected to
the ground terminal of a transmitter should present a high impedance
and a high voltage at the chassis. A quarter wavelength counterpoise
should present a low impedance, low voltage connection at the
chassis. Due to coupling effects in the nearby enviornment this
may not work out. You may have to adjust the length of the counterpoise
or use a matching network to get the desired results across a band.

A short answer is that a counterpoise must radiate to work.

>Also, how can base fed vertical antennas without an earth ground be
>decoupled from the feedline?

With coaxially fed antennas, a quarter wave decoupling sleeve is effective, or you can try a ferrite choke over the feedline. With balanced feeders, it is generally impractical to decouple the line from an ungrounded base fed antenna. A base matching network that transforms the balanced line to an unbalanced feed for the antenna should work, but generally the feedline still develops common mode currents that are difficult to suppress. Again this is more of a physical problem than an electrical problem. Induction of the radiated energy, either direct or mediated by a conductive object in the near field, will often induce currents on the line.

Another, even simpler method is: buy gel-cells that don't require
current limiting.

Sonnenschein (a German manufacturer; I think that's the right spelling)
sells gell-cell batteries that are generally similar to those of other
manufacturers, but they state that charging simply requires a constant
voltage of 2.3 V (+- 20 mV) per cell. Even when deeply discharged,
the cell limits its own charging current to a value that won't damage it.

>then I'll mention it to the FCC.

I haven't seen the film yet, but it's quite possible that it's a
MODIFIED ham transmitter. As I did in 1969...

I took a 1956-vintage Tecraft TR-20/50 and converted it to the FM
broadcast band. The classic 3-tube design (Osc/tripler, doubler, final)
was easy to modify to have a doubler in the final (a 6360). Then to
boost the power, I eventually added a straight through final. The
modulator was a Heath VF-1 with a power diode added as a varactor. All
ESTDs (toobz).

A subsequent owner bought a cheap Precision Electronics stereo generator
and got the whole thing running in stereo. Norton (the Tecraft's name)
did faithful service...

626. Equipment recommendations, new shack, HF Verticals

Newsgroup: rec.ham-radio
Date: 1990-08-25 01:56:22 UTC
From: d_reeves@oxy.edu
Message-ID: <108407@tiger.oxy.edu>
Source record: 9037

The story thus far:

Several of us have ben trying to set up a shack on campus here for
a long time. We finally have gotten an initial approval for the idea,
and are now writing up a proposal and shopping list. The shack is to
be used for regular use, but is also to be dedicated to emergency use.
If any of you on the net can comment about any of our equipment choices,
please e-mail direct or post if you cannot.

For HF antennas, one idea is to use a Cuschraft R-5 for 10,12,15,20m
and a butternut HF2V for 40,80m. Any ideas for beter choices than the
butternut? The other idea is to use a cuschraft A3s for 10,15,20m and add
the A743 add-on for 40m. Any ideas on how well this works? It would
be quite nice to get some gain on 40m without a dedicated, large 40m beam.
For 80m, again, the idea is to use a butternut HF2V.

A Kenwood 440s/at is the HF rig choice, due to it's small size, decent
cost, built-in tuner, and reliability.

We are considering getting a linear amp, and the ameritron AL-80A looks like
a good choice, due to it's high output, small size and portability.

Thanks again for the responses.

The first radio I ever built was the old Lafayette Explor-Air super regen SW receiver when I was a kid in the mid-60's. I built it using a soldering gun (remember when you couild get away with that?). That radio is long gone, but I found one at a hamfest recently, and picked it up for nostalgia's sake. Unfortunately, it doesn't work very well, and I'd like to fix it up.

Does anyone out there in netland have a copy of the schematics and/or manual for this radio, or for a similar rig? It used that neat trick of the using a tube set whose filament voltages added up to near 117V, thus cutting costs. Many super regen radios used the same tube set, and I assume have similar circuits.

I'd be glad to reimburse for copying & mailing expenses. Either a reply here or direct email (elkind@crboss.enet.dec.com) is fine.

It may be more convenient to use the list in the back of the post office zip code directory. It lists every zip code, in numerical sequence, followed by the name of the town.

There is also a little book published by Pilot Books that allows you to link zip codes to telephone area codes. This is very useful for multi area code states, where the area code boundaries are not obvious to those of us from out of state.

The book from Pilot is only $3.95. E-mail me, and I'll send you their address. I have the book at my office, and I am at home right now. Otherwise I would post it.

Hey! So this isn't the case of a converted 160m transmitter. I doubt
that most hams could modify an old HF radio to transmit wide-band FM
on 92.0 Mhz. Now, I'd doubt even more that there are many high school
students who could do that.

636. Internet link via RF

Newsgroup: rec.ham-radio
Date: 1990-08-27 00:00:10 UTC
From: mrapple@quack.sac.ca.us
Message-ID: <651715209.786@quack.sac.ca.us>
Source record: 9045

Hi. I'm an advanced class ham, I own a Sun 2, and am about
a hundred meters away from an internet site. I could,
conceivably, make a packet radio link on 900 Mhz or
something to link my site to the internet site down the block
and thereby get on the internet (ignoring administrivia for the
moment - this is a a technical and FCC-legal excercise).
The trouble is if I operated this under the auspices of my ham
license, I'd have to insure that all the stuff that goes over
that link is ham-legal. rec.humor would not qualify, obviously.

What alternatives have I? On the building at the internet
site, I can put up as good an antenna as is necessary. At
my end, however, I have the usual condominium restrictions,
but an outdoor loop antenna or a small UHF beam would not be
too much of a problem. With this in mind, I can probably get
away with less than a watt, probably less than half a watt.

With all the talk about wireless speaker installations, etc,
I'll probably be the black sheep for suggesting it, but
can I operate in 902-928 with low power under part 15 for
this application? Is there any other LOW COST alternative?
I am only doing this to save myself having to use the phone
all the time to transfer news, etc. If it's going to cost me
more than time and buying the gear, I may as well use the phone.

Now technically: SLIP will be operating on the serial link,
so error correction or detection/retry is not necessary.
To make it simpler, full-duplex would be best. Is making a
simple FSK transmitter/receiver for each end the best way?
How much of a shift is necessary to achieve 19200 baud? How close
can I get the two signals (one each direction) without buying duplexers?
Am I wrong about this being the best way to do it?

While the magmount antenna LOOKS more like it can be stolen, the permanent antenna installations can still have at least the whip and spring portion taken. I guess that is less of a loss, and less likely to happen, but it would be a hassle in any case.

I haven't seen it, but I've seen a couple reviews - both highly favorable. If it's a 'hit', we'd better think twice about coming out against it. [:-)

I have a non-working radio for parts or repair.
Best offer takes it. Looks new on the outside, never been opened.
So far the high bid is $30. I have a owner's manual which contains
a reduced size schematic that would be usuable if you enlarged it.
The product is featured in the Grove Enterprises catalog and is sold
under several other brand names. It is identical to the Realistic
DX 440 for example. Current Grove price is $196.00 plus shipping.

Here's a little more info on the unit:
AM/SSB/CW reception from 150 kHz to 30 MHz
FM from 87.5-108 MHz
Keypad frequency entry and tuning dial. Illumninated LCD freq. readout
Scanning with 9 memory channels. Wide/Narrow selectivity switch.
Bass and treble controls. Direct selection of 12 SW broadcast bands.
Clock with preset freq. alarm and sleep function. Battery or AC power.
Headphone jack for stereo FM listening. Five step led signal strength indic.
BFO and RF gain control. External antenna jack.

> cellphone hardware as a transceiver subsystem with 850MHz or so IF
> and upconvert to microwave.
> Other experimenters' opinions are sought!
> Also does anyone know what brand names Philips/Signetics cellphones are
> sold? (In US? In Europe?)

A friend of mine who works on cellular phones tried to simply move
the operating band of the thing up to the 900+MC ham band. Without
much other effort, it was fairly useless up there. The circulator/
duplexer doesn't hack it obviously, and the receiver and transmitter
pooped out pretty much.

It would take some component changes, meaning some custom machine
work, but I think his basic idea was sound.

We had intended to use these as link transceivers for a repeater system.
Right now we're using 450MC stuff, and it is getting crowded down there!

Any other thougths?

> If the movie _pump up the volume_
> depicts an unlicensed kid using an _amateur_ tranceiver to broadcast an
> illegal radio program, then what frequencies do you think he'll be using?
> _AMATEUR FREQUENCIES_!!! What frequencies will all of the copycat morons
> be using? _AMATEUR FREQUENCIES_!!! That bothers me.

Good!

Wake 'em up!!

By the way, I saw the movie last night, so that I get MY facts straight.

The phrase "amateur radio", "ham radio", or the like was never mentioned.

"My dad gave me this shortwave radio so I could talk to my friends
back in New York."

He was on "92" (megacycles?). Unless that's some newfangled repeater
frequency, then I have never heard of it on any ham band.

There are quite a few FM exciter and amplifier kits available to
those who seek them out. Some are actually pretty decent, with
stereo encoders available as options.

Whadda ya all afraid of? Some pirate will have something substantive
to say while the rest of you are screaming blue murder at each other??

|> [...] ...it might make sense to require
|> stores to see a copy of your license before buying anything that transmits.
|> Before you rent a plane, you gotta show your license.

That's because the renter is concerned with identifying you in case of theft and is also concerned with liability laws. You don't need a pilot's license to build or buy an airplane.

|> Before you rent a car, they gotta see your license.

Same thing. You don't need a license to buy or build a car.

|> Before you go fishing in a managed area, you gotta show your license.

You're probably thinking of some law local to you. It's not a general thing. But in any case, fishing licenses don't prove you know how to fish -- they're just a method of collecting taxes. Not a good comparison.

|> Before you buy a handgun (in some places) you gotta show your license.

But not all places. Flawed again. In NH you have to show your driver's license. Maybe this means we shouldn't sell transmitters unless the purchaser can show a dog license, it makes as much sense.

|> Before you buy alcohol, you gotta show your ID.

HA,HA,HA,HA,Ha,Ha,Ha,ha,ha,ha! You kill me! What a sense of humor.

|> This idea isn't without precident.

But it IS totally without merit. Maybe that can make up for it.

In the case of hams, though, there could be one
|> exception. If you're trying to get a ham ticket, and you want to buy a
|> transceiver, a signed affidavit from a licensed ham stating that you're under
|> his supervision and that you'll be responsible if the aspiring ham messes up,
|> until he gets his license for real. (Elmers still exist, don't they?) I know
|> that new laws are usually stupid and not thought out, but this one might
|> actually make sense.

No, I'm sorry, it's stupid and not well thought out. It was stupid and not well thought out when Phil Howard proposed the same thing last year. Who the hell are you to tell me that I need a note from some overbearing old fart that says I'm *allowed* to have a radio because I'm being supervised? Beyond that, what is the liability if I (as an overbearing old fart) certify someone who decides

not to get a license? Do I have the right/responsibility to confiscate the radio? Does the store that sold it have to buy it back at full price even though it took a few years for the owner to decide they'd never take the test? What are the people at flea markets supposed to do? What happens in the case of private sale? What if you don't live anywhere near a ham and so don't have an overbearing old fart who'll sign your note? What if your license expires, but you still have an old transmitter in the garage?

I know you're trying to come up with a solution to something you percieve to be a problem. I don't believe it is as big a problem as people who like to worry about it wish it were. In the only instances above where you cited licenses that are supposedly proof of ability to operate (cars and airplanes), there is no precedent for making a license required to buy the item whose operation is restricted. It is illegal to operate a ham transmitter without a license. The FCC *is* prosecuting cases where unlicensed operation takes place. There is no need for a "fix" that will open up a whole rat's nest of liability problems and make it even harder for new hams to join up.

In an earlier article I (Ron Todd) write:
> > Gary, it could be either. What is a 6db voltage (or current) ratio is also
> > a 3db power ratio.

The opperative word was ment to be RATIO. A 2:1 voltage ratio is 6dB while a 2:1 power ratio is 3dB. Maybe what I said didn't sound like what I said. The

There was a lot of discussion about S-unit definitions back in the 40's thru 60's, ARRL handbook gives some hint about it, the relevant text is unchanged except for typos from 1978 thru 1990. Some manufacturers wanted a base s-9 to be 50uV others 100uV, the variation in scale factor was from 3dB to 6dB in definition and from 3dB to 8dB in practice. In the past receiver sensitivity was specified in microvolts, currently it is appropriate to specify receiver sensitivities in decibels relative to miliwatts. As a result, the dB definintion of an S-unit could be viewed as having changed; a doubling of the microvolts would result in a 6dB S-unit scale while a doubling of the miliwatts would result in a 3dB S-unit scale. So, Gary, it could be either.

Ron K3FR

649. A Db is a dB is a DB is a db

Newsgroup: rec.ham-radio

Source record: 9066

A 3 dB change in a single (roughly) doubles it's power. Period. All things being equal, a 6 db change in a signal will double it's voltage. Since all things ARE the same, doubling the voltage will double the current, quadrupling the power.

The conceptual problem that most people seem to have trouble with is that you can't change any parameter in a vacuum. Ohm's law applies in any real world application that you are likely to consider. (Ohm's law is like Newton's, there ARE cases where it doesn't apply, but few of us are likely to encounter them).

More Trivia... The dB stands for Decibel, that is Deci-Bel, or 1/10th of a "Bel". The Bel is a unit of _power_ devised for measuring sound levels by, you guessed it, Bell system engineers (in the 20's? teens?, I dunno). It turned out to be a little big for it's original intended purpose, so it was subdivided into the decibel. The original goal was to develop a unit of measure that represented sound power changes as percieved by listeners.

The decibel turned out to be very convenient for a whole bunch of applications because it simplified the mental math required. Complex multiplication became relatively simple addition.

I'm getting ready to purchase software for my IBM (clone) PC... 386, 25MHz, no co-processor, Super VGA (800x640). I've narrowed the choices down to InstantTrak and QuickTrack (both available thru AMSAT), but I'm not sure how to choose between the two. Could anyone out there who has used (or seen) either of these products please offer any recommendations or comments? With the SAREX launch upcoming, I'd like to get this as quick as possible.

Also, does anyone know if AMSAT will take a phone order with a credit card?

Also ^2, I'm not currently an AMSAT member, which means an extra $20 on the cost of either of the two packages. The annual dues are $30, which would be an extra $10 more. What EXACTLY are the benefits of joining AMSAT, besides the lower price on the software (and the knowledge that I am helping out financially to support their work, which I know is important)?

TNX in advance!

I use a DB Products 5/8 mag-mount on my Ranger pickup. It does at least as good a job for my 25-watt rig as a 1/4 wave hole mount on as similar vehicle with a 40-watt rig. The only problem I have with it (and it's not really a problem - just an inconvenience) is I have to watch out and not use parking garages unless I tilt it over first. I could have gotten one with a spring attached if I had been thinking.... oh well. I ran my coax to the bed-illumination light and fabricated a metal plate to replace the light itself. I mounted an SO-239 connector on the plate, ran the co-ax to that, and cut off all but a short piece of the coax that came with the antenna. This way, I can use it on my XYL's car (after lots of QRM) for temporary installation, using an extension piece of coax. I like the mag-mount.

> The BP-90 as supplied cannot be recharged, as far as I can tell.
^^^^^^^^^^^^^^^^^^^
The author mentioned his information came from an R1.... I have the IC-24AT (USA version) and have just purchased the BP-90 (this allows one to use "AA" alkaline or NICAD cells)... The manual (sheet) that came with the BP-90 states that it CAN be charged either with the IC-24AT or the AD-14??? (I am not sure of this adapter number, not having the instructions in front of me now).

The IC-24 will charge NiCds in the BP-90.

The clip on style charger will also.

The drop in quick charger WILL NOT. There are no connections on the outside and no current sense dimples either.

Hope this helps...jv

RE the policies and standards issue, I know it's old, because I have been using this as a disclaimer for some time. It was taped to a desk I inherited over 15 years ago. As for KHz vs kHz, anyone who has brains enough to pour water out of a boot will know it means kilohertz, so what difference does it make? I average about 5 digests a day from this news group and 90 percint of it is wasted airspace, so I figured i might as well add to it.

Press on with pride. It's obvious most of the posters don't read what they write.

i just worked a guy last night that was running 8 watts on AO-13
and he was 5x7 - very nice signal !!! he was running a homebrew
10 element 435MHz antenna, and i was using an old 2m cushcraft
antenna (w/ an ok preamp) on my side -- i'd say this adequate
equipment was doing a pretty good job...

joe ka7ldn

ps. phase3-d should help, the uplink power level requirements will
be less, and it will downlink more power than phase3-c.

I saw "Pump up the Volume" this weekend. "Ham" or "amateur" radio is never mentioned at all in the movie. In fact, the only reference at all to the radio equipment used comes when the main character says that his father "bought him a shortwave radio so he could keep in touch with his friends back east." Interestingly, there is no mention about how the pirate uses his "shortwave" radio to broadcast in the FM radio band.

I seriously doubt that anyone seeing this movie will make a connection, negative or otherwise, with amateur radio.

}I don't police the whole RF spectrum - just the parts I'm licensed (or
}granted) to use. I'm a ham, so violations in my part of the ham bands
}bother me. I also use a cordless phone. People running illegal transmitters
}that interfere with my phone bother me. If the movie _pump up the volume_
}depicts an unlicensed kid using an _amateur_ tranceiver to broadcast an
}illegal radio program, then what frequencies do you think he'll be using?
}_AMATEUR FREQUENCIES_!!! What frequencies will all of the copycat morons
}be using? _AMATEUR FREQUENCIES_!!! That bothers me. If he's using an
}AM or FM band transmitter, and he's not causing interference to another
}station, I don't care. If he's clobbering another station (unlikely),
}then I'll mention it to the FCC.

Go see the movie, and then comment. The kid in the movie is broadcasting
on the FM broadcast band, not "_AMATEUR FREQUENCIES_". The movie doesn't
depict the kid as using an amateur transceiver, in fact, very little mention
is made of the equipment used.

|> The various levels of Amateur Radio licenses were not designed to generate
|> a 'caste' system. There has never been anything that states that an
|> Extra class licensee is in any way better than a Novice licensee!!

Gee, I don't want to be the one who speaks the discouraging word after your wonderful and should-be-true-even-if-it-ain't posting. For the most part, I genuinely agree that it is attitude that makes the ham, and that people should realize that usenet isn't ham radio. (That's why I support the creation of rec.radio.ham.armchair_lawyers -- so my kill file doesn't have to do all the work.)

However, I think you're mistaken on the caste system issue. The additional frequencies I got as an Advanced are not even slightly related to the additional privileges provided by the license. In fact, there are no additional privileges besides the HF frequencies. When I upgrade to Extra, I'll get a few more slivers of HF frequencies that are in no way related to space operation or being a VE, which are the only new privs bestowed. Clearly, there was effort put into designing a system that creates castes.

To me, in human terms, it makes sense -- the design seems pretty much a copy of the mind-set of the times it was created in. The fact that the design is considered faulty by today's standards is somewhat beside the point. Change will happen, even if it doesn't happen at the pace some people wish for. But there is clearly a designed-in bias which makes it easy to develop an attitude of superiority/inferiority based on license class.

In a recent QST a review of the CT computerized logging program was published. I am very interested to get a copy of this, IF, it can be modified or customized to work in the UK rather than continental US. For example, the article referred to CT's operation on the ARRL Sweepstake contest: can it be modified for some of the RSGB contests I wonder?

Thought youns would find the following interesting:

73,
Harry WA3TBL
hpb@hpb.cis.pitt.edu

==========

KANSAS CITY, Mo. (UPI) -- US Sprint has expanded its Military
Affiliate Radio System to allow military personnel stationed in the
Middle East to call loved ones back home for no charge in the event of
an emergency, the company saidMonday.
The MARS program, which uses a combination of amateur radio
operators and US Sprint's digital fiber-optic long-distance network, has
been used as a calling program for military personnel for seven years.
Medical calls from the hospital ships ``Mercy'' and Comfort'' and
all emergency calls put through by the Red Cross will be completed for
free, company officials said.
``This program has meant a lot to service personnel during
holidays, and we felt it might be needed now more than ever,'' said Ron
LeMay, president of US Sprint.
``We are glad to provide this service at a very difficult and
stressful time for military personnel and their loved ones back home,''
he said.
Under the program, amateur radio operators in the United States
will receive calls through MARS radio carrier signals in the Middle
East. The calls then will be put into the US Sprint network and routed
to their destination without charge.
The MARS program has allowed military personnel to place free calls
on Christmas, Thanksgiving, Independence Day and other holidays.
US Sprint is a unit of United Telecommunications Inc., which has
headquarters in Kansas City.

661. WEFAX and GOES Schedule

Newsgroup: rec.ham-radio
Date: 1990-08-27 18:53:54 UTC
From: paul@wa1omm.UUCP
Message-ID: <paul.4414@wa1omm.UUCP>
Source record: 9057

The following is the WEFAX Schedule as of 02-AUG-1990. All transmitted maps are black on white with the exception of the GOES photos. The latter are grey-scale. All transmissions are 120 lines per minute. If your TNC has a WEFAX mode, you'll be able to copy these maps very well. The GOES photos will even give you a good indication of cloud cover even if you lack grey-scale capability.

>nothing but vintage perrier to polish the bumpers....
>
>Seriously, mag-mounts are sh**ty antennas. You usually get superior
>performance by DRILLING a HOLE in the car and doing a real installation.

Maybe so, but in many cases people might not *need* superior performance.
I've gotten along just fine for years with mag mounts. Unless you're
marginal into the repeater (or into the other station if you're working
simplex), who needs the extra oomph?

I thought that drilling a hole in my 1971 Opel GT wouldn't be traumatic
since it was so old and a little banged up. But after I did it, I swore
I'd never do that to a car again.

It all comes down to needs and priorities. If mag mounts or clip-ons
are working fine, why drill holes?

Patty

p.s. Thanks for the tip on the Perrier. :-) Does it work on rubber bumpers?
If not, I guess there's no use buying any for the Porsche.... :-)

663. SAREX Operating Schedule

Newsgroup: rec.ham-radio
Date: 1990-08-27 19:24:25 UTC
From: techpubs@PRC.Unisys.COM
Message-ID: <14838@burdvax.PRC.Unisys.COM>
Source record: 8981

SAREX TIMES
Below is a tentative schedule for Amateur Radio Operations from Shuttle mission STS-35. Since the schedule is based on Mission Elapsed Time, this schedule will be updated and reposted soon after launch to show the "real" UTC times and dates. This tentative schedule assumes a launch time of 1 Sep 05:17 UTC. Data for this schedule comes from W3IWI's May 27, 1990 SAREX.009 AMSAT bulletin updated with the new robot operating schedule that appeared in AMSAT News Service Bulletin 237.04 August 25, 1990. I can not speak to the authenticity or correctness of this schedule (I'm just a number cruncher!). For example, is the Demo schedule still accurate? Or will there even be Demo operations during the mission? The "Demo" times are from the May 27, 1990 schedule and have probably changed by now. Anyone have any more accurate and timely information? Please EMail any corrections or information you may have.
73 and happy Shuttle DX'ing.

All things are relative...they are replacing a threw-the-window
installation..... And there are other considerations like I wind
up removing the antennas quite often to use them for ARES type
work. For this Mag-mounts are great. Again it's all a matter
of your intended use....for me they are the correct answer.

Yep, I saw it this weekend and thoroughly enjoyed it. First off, ham radio is mentioned EVER. I didn't see a single piece of ham gear in the movie. I did see what looked like an old HP signal generator(you know...the hernia producing type) being used as the transmitter(he went mobile with it? ;-)

The only group that came out looking stupid was the FCC. The guy protraying the head of the local FCC office (or whatever) had the last name of Watt? Wonder if that was in reference to a unit of power or a certain ex-secretary of the interior ;-)

Anyway the movie brought back lots of memories of my nefarious youth, i.e. I had a good time.

The question about light dimmer RFI has appeared on the net. I remember seeing some time ago, at Channel's (a home supply store), a variety of light dimmers. One was the El-Cheapo. Another model claimed to have RFI suppression built in. Didn't try it, so I don't know how good it is. Probably just lets you hear local AM mw stations.
If your neighbor in the condo uses the El-Cheapo, you're probably out of luck.

I once did something like this for a model railroad fast clock (so the model railroaders could run the toy trains on a schedule, playing dispatcher). What I did was use a clock chip that can be set by pushing a button to make it step thru the time at 60x real time. (not the "set the hours separately from the minutes style"). I wired the chip to be in this slow set mode, and then I fed it a low frequency to clock it. The low frequency came from a divider that divided 60Hz by 6 or 12. Or you could do some other factor if desired. Or build a low frequency osc.

}movie 'Pump Up The Volume'. The story appears to be something about
}some high school students putting together a bootleg broadcast
}station. It just so happens they use an amateur transmitter to
}do this. Some folks here feel this is a problem, that it may/will

}either case, the fact a movie has ficticiously shown a ham transmitter
}in use at a bootleg station probably won't do much to stimulate the
}mis-application of ham gear.

For the last time NO! This movie does not show a ham transmitter, or anything
that resembles a ham transmitter in use at a bootleg radio station.

I've seen the movie--the transmitter involved looks more like an HP signal
generator than a ham transceiver. Amateur radio or the word "Ham" are never,
repeat, never mentioned in the movie. Enough said...

Hi netlanders,
What is the status of the amatuers in Kuwait? Is anyone on the air?
I had a call from a student at Oregon State Univ. who was wanting to see if
he could get any info about his family via amateur radio. Does anyone
know? (The student had heard that there was a amateur station in Oman that
could be telephoned requesting info. If you then called back in 8 or
10 hours there may be info! He hasn't tried it though).

Any info you can give will be appreciated. Post it here for net wide
reading or send to me directly and I will repost a summary.
Thanks in advance. 73

673. The Amateur Radio BBS...

Newsgroup: rec.ham-radio
Date: 1990-08-27 22:00:24 UTC
From: howardl@wb3ffv.ampr.org
Message-ID: <3702@wb3ffv.ampr.org>
Source record: 8989
Cross-posted to: rec.ham-radio,alt.bbs

I constantly see requests for various ham related software like NOS, NET,
and many other programs. Here is where you can find all of the latest
and greatest stuff, so have a blast...

+--+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.08)
AA4RE BBS for the PC (Version 2.10)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners

Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Yes, Patty, you certainly don't always need the best possible signal. Listening to any repeater in any large town will reveal a large number of people who have taken that philosophy to heart, and seem to revel in the less-than-best signal they put out. You regularly hear people who are noisy into the repeater and yet seem to have no trouble hearing it.

Most repeaters are designed to have roughly reciprocal coverage with a 10 to 25 watt mobile and a properly-installed car antenna. In many cases, back when I was doing that sort of thing for a living, I'd find that the antennas were installed with high SWR, bad grounds, and similar problems. These all caused the transmitter to back down its power to protect the final stages - some of the people with 25 watt radios were in actuality putting about two watts into their antenna!

Really, it only takes a few minutes to install an antenna properly. I have a great deal of trouble understanding why someone would spend $400 on a radio, another $50 on an antenna, and then wimp out at the last minute and not install it properly! Probably didn't drill holes in the dashboard either.

The cynic in me insists this is just one more aspect of the great american lack of drive for excellence. The technician in me says it's more likely that they're afraid to. After all, how many american hams have adjusted the mic gain and/or deviation on their radios?

I wonder what percentage of Japanese hams have drilled holes in their cars to permanently install antennas? It would be an interesting statistic! (Yes, I know, many fewer cars in Japan. %!)

(Note: nearly all rice-rockets come with the microphone gain set 'way too high for mobile use. Just listen to the local repeater - if you can hear road noise and the dude's window is up, he's got too much gain. But most hams don't realize that. Classic conversation: on hearing the NEIGHBOR's dog barking in the background of a ham transmitting from home, I advised him to turn down his mic gain. He apologized for crowding the microphone and backed off, whereupon the dog's voice overpowered his. And this guy is a police dispatcher - a "skilled professional radio operator" with an Advanced class license. Arrghhh!)

1. Since when was there a "forsale" group? I've never see this one added.
The discussion that created .swap considered that named and chose this
one instead.

2. Why the cryptic name for the discussion group? And how to you DEFINE
what constitutes a "discussion"?

3. It has been proposed the have rec.radio.swap instead of rec.radio.ham.swap
so what is your reason for not having that?

Thanks for a good article on LORAN; it helped to take away some of
the "magic" aspect of the thing. I've got a fairly cheap handheld
unit that I carry along in the backcountry just for the hell of it
to see what it will do. Grounding it properly makes all the difference in the
difference in the world between results and nothing at all!

Can you point me to any literature on LORAN? I'd like to learn more
about it. This receiver requires 3 signals to get a fix; is there
any way I can do it with just two? I'd appreciate info. Thanks!

Ken

Yes, I certainly have! But I'll bet they're virtually all using rubber
duckies. Unless you're blocked by a mountain or some such, even a
1/4-wave mag mount can give a solid signal in most instances. Of the
3-4 repeaters I use occasionally, I only need the 5/8-wave whip to get
cleanly into one (about 40 miles away). (This is with a 2-watt HT.)

The point is that if the 1/4-wave doesn't give satisfactory results,
switch to a 5/8 or a drilled mount or both. But if it works and the car
owner prefers it, why not stick to the simpler and less damaging solution?

>(Note: nearly all rice-rockets come with the microphone gain set 'way

>But most hams don't realize that.

Amen to that. I've especially noticed that in the past few years. I'm
not sure what you mean by "rice-rockets"[sic], but it seems like the
newer HTs tend to have a really high mike gain. My older one (ICOM 2AT)
isn't like that, but my Kenwood TH-21 is a little hotter, and I've
heard others that are really a problem.

I saw the film Friday. It has nothing to do with ham radio, in fact, the words "ham radio" are never mentioned. The film is essentially a sociological study of boredom among teenagers in suburbia. It was a good movie until it decended into stereotype characters/situations towards the end.

It was not plausible technically, unless you can figure out how to alter a "shortwave set" to broadcast on 92.5 mHz.

-Randall KK6MY

There IS one advantage to call-plates as yet unmentioned here:
parking tickets

What IS he talking about?

Ohio went to 3x3 plates (ie ABC-123 or later 123-ABC) plates
several years ago. When they did, gas-jocks and jills starting
giving such a hard time on credit card purchases that I would
say without prompting:
WB8FOZ, yes it is
before they said "That's not an Ohio tag"

But I ALSO found that when I got parking tickets, I NEVER got chased
for non-payment. Since others caught at the same places did, I finally
concluded that the keypunch clerk was as adept as the gas folks, and
just deep-sixed those tickets with "bad" tags.

Life is rough, sometimes ;+}

>Read some movie reviews. Read the previous postings more carefully.
>But most importantly, connect with reality. _AMATEUR FREQUENCIES_!!!
>Yeah, right.
>

You give the general public too much credit. If a kid sees a radio in
a movie that is shown to be able to make him more popular, don't you think
he'd like to get one? And do you think the average kid (or ham, for that
matter) is smart enough to know how to modify it into the bcast bands? I
think not. So if a kid gets his hands on an HT, say, why wouldn't it
seem perfectly logical to him that it should work? (Lets see, it's an
'amateur' radio, like the movie said, and it says FM on the side, humm,
that must mean I can receive it on my FM radio!!!) Same goes for am radios
and HF rigs. Believe me, the general public believes what the movies tell
them about radios and what they can (and can't) do. Take a look at Die Hard
2, and tell me that those Kenwood radios can do all of that magical stuff
the bad guys say they can do. They also believe Alf can take to his alien
friends on the HF rig in the garage. I've seen and stopped more idiots kids
of this type that think they're cool for using (usually stolen) ham equipment
to jam/kerchuck repeaters. (I've been into radio since I was in junior high.
I've seen this with my own eyes). Whether you choose to believe it or not,
this kind of look-alike copycat mindset exists, and has caused (and will
continue to cause) problems on the ham bands.

>Its too early in the morning. I really shouldn't be doing this. But,
>I just can't stop myself.

Real Hams drill holes, or have them drilled for them. The installation
of the radio in the car is much neater and less of a kludge. No more
coax snaked into the window, down the back seat etc. No more worrying if
the door was closed on the coax.
BTW to clairfy one other myth, drilling HOLES does not usually detract
from the trade in value of an auto. True story to follow:
There was this ham with a hole drilled in his car. The car was fairly
new but he felt it time for a new one. He was negotiating the deal when
the salesperson noticed the antenna mount on his car. The salesperson mumbled
about having to take it out, costing a lot of money for the work, and so
he would have to take off $750.00 to $1000.00 from the trade. The ham was
appauled, but thinking rapidly said to the sales person, "a thousand less ??!!
No, You mean $500.00 MORE !" The salesman was alarmed and puzzled. The ham
went on to explain thet the car was "already wired for a cell phone antenna".
And so it went. Next week the ham drove by the dealer and there was the
car for sale with a large sign proclaiming "wired for cell phone !"

Having listened to CB lately, it is my opinion that the FCC doesn't
really care what type of emissions are used.

I would hardly expect that CW would stand out from all the other
noises being generated at 11 meters.

Actually, I wish computer hobbyists would start running packet on
CB. Then maybe it will get some worthwhile use.

Gareth--the CT program is specific to the CQ WW, ARRL DX, and WAE contests. And believe me, it's a pleasure to use in any of them. It can surely be used from anywhere in the world.

BUT it's not the kind of program one would want to modify. The quintessential, generic contest logging program has yet to be written, if it ever can be--and many of us are waiting for it. The biggest problem is that each contest has a different set of multipliers and that database has to be created and queried by the logging program. It would laborious to say the least to manually enter the multiplier database for, All Asia, SEANET, or some of the smaller DX contests, for example.

Again let me emphasize that the CT program is EXCELLENT, but it is limited to 3 contests at this time.

691. IC-24 Expanded Transmit Range

Newsgroup: rec.ham-radio
Date: 1990-08-28 16:15:06 UTC
From: john@qip.UUCP
Message-ID: <4247@qip.UUCP>
Source record: 9009

If you are like me, you are eagerly looking for an article telling you how to open up the transmit frequencies on the IC-24. I have need of transmitting in the ranges 140-144 and 148-150 MHz on military frequencies for which such equipment is needed. I'd also like to transmit in the 420 band for work on link equipment. I suspect lots of other folks have the same need.

Now for the bad news: as far as I can tell, there is NO mod to open the transmit range of the IC-24! If you know differently, please tell me. If this is true, I think we should all complain to ICOM.

For your 100m link, consider 10GHz. Lots of folks (not me) have made significant progress in this type of hardware - like achieving ethernet speeds. Since the signal isn't even close to omnidirectionally transmitted (assuming dish or horn antennas), you might be a little less concerned about the content (go ahead, send rec.humor) - not that I'm endorsing this of course.

Or maybe use unrestricted frequencies - visible or IR light. A couple of pairs of binoculars with light emitters (LEDs) and photodiodes at their foci might make a dandy full-duplex link. The antennas are the right size :-) I've always wanted to try this out but never find the time.

No it is not. Rules say you must transmit in plane english, and at 5 watts or less. But, FCC really doesn't care what you actually transmit, or how much power you use in that band. I know people who regularly send at 100 watts of power. It's most anoying since you can here them across 10 or more chanels.

694. 1296 MHz receiving and transmitting convertors?

Newsgroup: rec.ham-radio
Date: 1990-08-28 17:24:12 UTC
From: brian@ucsd.Edu
Message-ID: <18010@ucsd.Edu>
Source record: 9000
Cross-posted to: rec.ham-radio,sci.electronics

Rather than design and debug my own, I'd like to find a source of kits or modules to convert between the 2m and 1296 MHz ham bands. The application is to build a repeater using an inexpensive 2m exciter and receiver with the channel frequencies being in the 1282 (tx) and 1262 (rx) area.

I've got about 100 mw of 2m to upconvert; then I'll amplify it to the proper output power. The receiver is 2m also, and quite sensitive.

This is FM, so a linear mode isn't necessary. The receiving converter and transmitting converter would be best separate so I can operate them simultaneously and shield them from each other.

Any suggestions as to suppliers, or experience with particular models you've used?

Recommendations on a duplexer would also be appreciated.

Subject: Ham plates in CA
I have had my call on two cars at the same time. When I was in the
Air Force, I would keep one of my cars registered in CA (with ham plates)
and register the other in the state where I was stationed (ham plates also).
My legal home has always been CA so that is legal. Made it easy to remember

A friend tried to register his car where he was stationed but without bothering
to find out the rules for ham plates. He tried to do it as a vanity plate,
and was not permitte since it was a reserved (for hams). His call was from
a completely different area so it was surprizing they cought it.

697. Metropolitan Area Positioning System

Newsgroup: rec.ham-radio
Date: 1990-08-28 18:18:44 UTC
From: scottp@eecs.cs.pdx.edu
Message-ID: <SCOTTP.90Aug28101844@eecs.cs.pdx.edu>
Source record: 9019

I recently read an article from QEX about DSSS, and the use of vertical retrace from a local TV station to synchronize the noise generators. That eventually gave me a totally different idea ...

I can see where it would be useful for packet nodes to know their location to within a few hundred meters. Besides helping the operator when they get lost looking for a garage sale, it helps the terminal know what cell it's in in a cellular access system.

If there were several beacons in a city which can be received simultaneously, and for which the positions are known with high accuracy, a receiver ought to be able to determine its location. This requires that it know its initial position, and that it notices discontinuities in beacon patterns. It also requires a protocol for mobile stations to query permanent stations for certain local parameters. (I haven' figured out yet whether it's possible with a sceme like this for a station to completely determine its position with the help of one or two permanent stations. If so, it would greatly ease the configuration of a metro area LAN. Only a few of the fixed stations would have to get out the survey maps and determine their position to within 1m.)

The two regular beacons I can think of are the vertical retrace of all the local TV stations (6 here in PDX, 7 if you can hear Salem), and all the stereo beacons of all the local FM stations (a dozen or two).

With both of these beacons the problem for positioning is that you can only determine delta-x and -y from some known starting position. You must then watch it change and update your position accordingly. With the 19kHz stereo beacons, there is the additional problem that one cycle of 19kHz propagates about 10km before the next cycle starts. That means that if you stop listening in a moving car, you may have the wrong idea of where you are when you start again. The problem with vertical retrace is that the relationship of this between stations may change instantaneously when a station switches to another program (network feed from tape, etc.). Receivers would have to monitor several stations to notice this and apply corrections.

The Really Big Problem with both is the regularity of the beacon. Someone told me that the frame rate for color broadcast is not the same as for B&W. In any case, TV's should be relatively immune to irregularities since they resync for every frame (within limits). For the 19kHz stereo beacon, much averaging may have to be done to get a useful time reference. It may still be bogus if the beacon drifts around as humidity, temp, or phase of the moon (i.e. slowly).

Do these signals tend to be generated by crystal controlled devices? If so they may be regular enough for positioning. The thing is, unless regularity is required by the FCC, there's no reason for broadcast equipment makers

to design it in.

My question to all of you (yes, finally, the point :-)) is what is the accuracy of the vertical retrace signal and the 19kHz stereo beacon? What is required, and what is usually there. If some of you have worked in the broadcast industry, you may know this off the top of your head. (I'd have to bring a scope home from work and open up the stereo to figure it out, and what I find may not be generally true.) References to appropriate documentation are greatly appreciated.

To get positioning info accurate enough to tell what cell you're in, beacon accuracy of a few uS is needed. To tell what road your car is on, beacon accuracy in the tens of nanoseconds is required. I have a feeling these beacons in the broadcast band aren't even close.

Thanks in advance,
--- Scott Peterson

And there was the time in 1976 when we were all going through the gas crunch and I had the California plates "WA6IRH". In California, at least, we had the "even-odd" system for filling up your gas tank - even numbered plates got to fill up on even days, and odd on the odd. If there were no numbers in your plate the plate was considered to be "odd" (in more ways that one, it would seem). So, since the "6" (number six) looked like a letter G to most all station attendants, I could get a fillup on either day through persuasion.

Subj: Re: LORAN and Ham Radio

According to "Reference Data for Radio Engineers" (1977, Howard W. Sams),
there are 4 types of LORAN: A, B, C, and D. A is

there are 3 types of LORAN: A, C, and D. A uses pulse envelopes at 2 MHz
and is usable to several hundred miles; C uses 100-KHz coherent pulses and
is usable to over 1000 miles; and D is a short-range version of C. All
three systems require at least three transmitters.

This is a very simple description, and the book doesn't give any references.
It does show the assigned frequency ranges as 90-110 KHz for L-C and -D,
and 1800-2000 KHz for L-A.

> >alter a "shortwave set" to broadcast on 92.5 mHz.
>
> This simply begs for a flame from Bob Carpenter! :-)
> etc etc ....

If he means millihertz, who am I to bother him .....

All this talk of FM stations takes me back to the early 60s when I put WHFS (FM) on the air, marrying an H.H. Scott stereo generator, old RCA exciter and 1 kW rig that Maj. Armstrong had used in demos - which had 25 Hz power supply components since it had been used in upper NY state. (Niagara Falls generated 25-Hz power up to the 40s). All except the stereo generator had been used to get WASH (FM) on the air in the late 40s. But I had to saw the transmitter into 3 pieces to get it through the door at WASH.

To get to the point, I never did call "CQ 3 meters", but I came close... We had a 15-minute ham radio program each Sunday; talk about TRYING to go broke... Actually it was the next two or three owners who went broke. The latest two transfers of the station (102.3 MHz, Bethesda) were for $2M and then $7.5M, however - for a Class A FM. We sure got out too early!

713. modifying icoms (was Re: IC-24 Expanded Transmit Range)

Newsgroup: rec.ham-radio
Date: 1990-08-29 04:11:25 UTC
From: dt@yenta.alb.nm.us
Message-ID: <1759@yenta.alb.nm.us>
Source record: 8927

So far, every icom rig I've tried this on (02at,04at,micro2at,2gat,28a,28h,228h) is easily modified to transmit over its entire receive range. I could post what I've found out so far, if I could find it, but it's relatively easy to hack out your own mods.

Yer usual DISCLAIMER:
This posting is just general hints ... not step by step instructions.
This requires specialized tools and knowledge...and patience and care!
Try only if you have a teeny pencil type soldering iron, experience with surface mount boards and components, and feel you won't mess up your radio.

Still here? Ok...

If you examine the schematic, you'll see that connected to the processor is a diode matrix. Note the positions of all the diodes. You'll need to figure out what traces on the board correspond to what lines on the schematic.

Now carefully remove all the diodes (these are usually surface mount, sometimes each chip has three terminals, and may have one, the other, or both diodes present), and attach fine wires to each row and column of the matrix (following those traces is the hardest part!).

Now make your own diode matrix of the same size, on a separate board, but put dip switches in series with all the diodes. Any old 1N914 or equiv will do nicely. Be sure to use very fine wires to solder onto the icom board, watch out for static damage, observe polarity, etc.

If all goes well, you now have a switchable diode matrix. The matrix is read each time the CPU is reset. So reset it (check the manual for the radio in question) after dialing in the original matrix positions. If all goes well, the radio should behave normally. NOW -- flip one switch, and try it again. Pretty soon you'll know exactly what change each switch makes. One will let you xmit out of band. One will change the standard channel step spacing. One will change the coverage (for european models, shown in the schematic as an alternate), etc.etc.

Once you have hacked out the proper settings, just solder in diodes to permanently program the radio that way, and put it back together.

Hmmm now it doesn't sound that easy when I describe it, but I've done it countless times, with the owner of the radio hovering, and so far it's always worked. Note also that the matrix board you make is reusable...new icom? just break out the ol' switchable matrix board!

One notable exception...to get the 28a/h to xmit out of band, you just cut D21...no matrix programming change required. It's a different design, and it's easy to see what's happening in the schematic. Oh...and there are two

D21's in the 28a/h...get the right one...the wrong one is in the backup battery circuit and clearly has nothing to do with the transmitter portion. The icom 735 is also a one wire mod.

If you are considering this with any of the radios I mentioned above, email me for the mod to save yourself some time...but I'll bet you when someone sets a new one on my bench, the same old faithful trick will work again!

714. Touch lamp RFI solution and tracking methods

Newsgroup: rec.ham-radio
Date: 1990-08-29 04:25:19 UTC
From: jimla@tekigm2.MEN.TEK.COM
Message-ID: <9736@tekigm2.MEN.TEK.COM>
Source record: 9024
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I have been working on a solution to my touch lamp RFI problem. I borrowed my neighbor's lamp and tried installing a line filter in the base of the lamp. The filter reduced the noise level only 1 S unit. Since the lamp base cannot be grounded, common mode noise was not suppressed by the filter. Finally, I bought another touch lamp at the local builder's warehouse store. They had hundreds of them in several styles, all from the same distributor. I removed the base cover and discovered that the controller had been redesigned. It contained fewer components and was rated for 150 watts. There were still no RFI supression components (chokes or capacitors on the AC lines). The original was rated for 100 watts, and the neighbor had installed 3 40 watt bulbs, exceeding the rating. I could not hear any additional interference with the new lamp, but the neighbor's lamp was still plugged in, so it could have been masking the noise generated by the new lamp. I gave the new lamp to the neighbor, and told him to leave the old lamp unplugged. On returning to the shack, I could not find any interference from the new lamp. In case the information would be useful to others with touch lamp RFI, the manufacturer of both controllers is Darjung Industries, Taiwan. Model DLP-22 is the older design with RFI. Model T-30 is the newer design which did not cause RFI.

My method of tracing RFI sources is to carry my ICOM 735 around the neighborhood powered by 12V gel cell in my back pack. The antenna is a 2 ft. diameter shielded loop made with RG-8/U, matched to the ICOM with an L-network. The loop tunes from 10 to 30 MHz and has sharp nulls in the broadside direction. I was easily able to localize the source of the interference to the house and the interference was heard within a 3 block radius. Touch lamp RFI sounds like a growling buzz on an AM reciever, with a peak around 10 MHz and sidebands every 200 KHz from 5 to 25 MHz.

715. XT - what's the story?

Newsgroup: rec.ham-radio
Date: 1990-08-29 05:49:26 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <28951@netnews.upenn.edu>
Source record: 9025

After working an XT last night on 15, I compared 4 different sources and
can't come up with the right answer to this question:

What is the current and proper name of the country that XT belongs to?

The operator I worked (XT2BK if I remember right) said the name, but I
missed it due to QRM/QSB. It didn't sound like any of the names I had
listed:

Bukina Faso (sp?) (DXCC country list, PacketCluster)
Voltaic Republic (Beam heading chart)
Upper Volta (Soft copy of an older DXCC list)

Any definate answer?

716. Weird Shutdown of my Astron power supply while antenna tuning (RF?)

Newsgroup: rec.ham-radio
Date: 1990-08-29 05:51:34 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Aug29.055134.16823@midway.uchicago.edu>
Source record: 9026

Riddle me this...

I have an Astron RS-35M power supply (12v @ 35 amps). A few days ago, using this with a HF rig,I was "tuning" my dipole with a MFJ 949D tuner II at low power (about 5 watts). In the course of setting the inductor selector and antenna matching capacitor on the MFJ tuner the Astron simply "shut down". The Astron has amp and volt meters and the voltmeter which always reads 13.8 volts was reading only a few volts. I shut the Astron off, turned it back on, and agin it showed 13.8 volts. No fuse was blown, no smoke.. and I doubt that in the course of tuning by transceiver it was pulling no more than about 3-5 amps.

This happened a few times. Each time I turned the Astron off and then back on and it was fine. Three times and I gave up since I knew something had to be wrong.

Tuning another antenna this evening (a long wire) it happened again. Low power, CW, key down, 5 watts and the Astron shut down - this time for the last time. It didn't recover. Its "red" power light is on, no fuse blown but no voltage.

My guess is that the problem has something to do with RF getting in the power supply - what else could it be ? Clearly, pulling a few amps for antenna tuning wouldn't burden this 35 amp supply and no fuse was blown.

Looking at the schematic of the power supply I see 3 curious capacitors in various configurations on the heat-sinked power transistors with the note "C7-C9 added for R.F. bypassing".

What does RF have to do with a power supply. And, why has my Astron "shut down" on such a low power demand ??????????????????????????????????

Wondering....

Anybody got an answer.... or a guess ?

718. Re: CALL FOR DISCUSSION: Reorganizing rec.radio

Newsgroup: rec.ham-radio
Date: 1990-08-29 06:06:16 UTC
From: richard@hpfcdc.HP.COM
Message-ID: <7880260@hpfcdc.HP.COM>
Source record: 9021

Hi Phil,

>1. Since when was there a "forsale" group? I've never see this one added.
> The discussion that created .swap considered that named and chose this
> one instead.

Sorry, there's a group here by that name, it's probably some mistake.
I really don't think anyone would be confused if it was swap or forsale.
Upset -- maybe! Confused -- no! I see thigs "forsale" in "swap", I'd
expect to see "swap" things in a "forsale". You could even call it
"hamfest" (as I expect you know, you can buy new and used stuff at a fest.)
Of course if it was called "hamfest" maybe those postings for MIT hamfests
would get out of my face since I'm not driving 3000 miles to be at one.
The point is that "swap" is just fine.

>2. Why the cryptic name for the discussion group? And how to you DEFINE
> what constitutes a "discussion"?

Other groups often use the ".d" suffix to denote a discussion group.
Calling it "rec.radio.ham.discuss" would be fine.
The reason and definition would be to seperate the issues from the facts.
In other words, if you post a technical question that gets a lot of
responses, that's fine. However, if you post something like,
"CALL FOR DISCUSSION" or "SHOULD THERE BE A NOCODE LICENSE" or
"PUMP-UP MOVIE BAD FOR HAMS" or "FCC PROPOSAL", or almost anything
that starts with a "RE:", these are postings that are likely to generate
lots of comments, observations, opinions, and long discussions.
(just like I'm doing here, now). As you notice in what I'm writing,
there is no "question" that I'm trying to ask, there is no one answer,
we are discussing an issue. And that is good and useful, but it's not
a technical question that can have a technical answer. Of course you
could take a contrary viewpoint, but that would be a discussion. Yes?

>3. It has been proposed the have rec.radio.swap instead of rec.radio.ham.swap
> so what is your reason for not having that?

I missed it. (Sounds fine to me, but I don't look forward to someone
trying to sell me a FM table radio.)

As to why I changed my mind, the more a topic gets splintered, the more
likely I'll miss something. Since I don't always have time to read all
notes, splitting the discussions off into another group will just
make it easier to skip the ones that I'm not interested in. Or save them
for when I have more time.

THANKS for listening

Here in Maine it is also same as vanity plates, $20 per year.

Incidently, when I was in CA (75-77) they would not issue plates
with out of state calls. I was WA2JAM at the time. I guess the rule
was if the first character was a K or a W and the 2nd or 3rd character
was other than a 6 they would not issue. I got around it by using
my bicentennial call AA2JAM and taking them as vanity plates. Is this
one still in force? If so then there's a spot for you CA hams to
ticlke your state government on. Are there any states which will
not issue for "out of state" calls?

I had no trouble in either Utah or Maine, just submit a copy of
my station licence.

Are these the same rules that require you to identify with your FCC
assigned callsign even though they stopped assigning callsigns years
ago.
I realize there is a supposed formula for fabricating callsigns now, but
that kind of defeats the purpose of having FCC assigned callsigns anyway.
And when was the last time you heard of anyone being cited for failure to
identify.
The CB regulations are like any other un-enforced law. When you let people
ignore one law, it weakens all the others too.

721. RF IN POWER SUPPLY

Newsgroup: rec.ham-radio
Date: 1990-08-29 13:13:38 UTC
From: cfishman@PICA.ARMY.MIL
Message-ID: <9008290913.aa05459@FSAC1.PICA.ARMY.MIL>
Source record: 8929

To Gary and his Astron power supply.

Yes Gary it is very possible that your supply shut down because rf was getting into it. The power supply on my Drake TR-7 does the same thing when my antenna is not tuned correctly and rf is in the shack. The capacitors you talked about and I'm not sure from your posting if they were installed in your supply or not are probably bypass caps to reduce the susceptability of your supply from rf.

It is possible that the power supply leads are acting as antennas and picking up rf in the shack. Try to put a sleeve of ferrite over both leads. This will reduce the common mode noise that is the rf common to the plus and minus leads of the supply. If you need more info try to call me. I tried to e-mail direct to you with no luck.

From: cep@cci632.UUCP
Message-ID: <39557@cci632.UUCP>
Source record: 8942

As I mentioned when Die Harder came out, all the radios used there were ham radios, too. I suppose it doesn't matter that the guard on his IC-u4AT was talking to the army on their kenwood 950. Commercial transmitters are big and ugly and have very few knobs, and even fewer LED's and readouts.

WZ2B

P.S. Could the "ham plates in CA" discussion please make use of the "distribution" line? I always encourage the use of limited distribution where applicable - every once in a while, people forget this.

723. Civilian Welfare Traffic into Kuwait

Date : 28 August 1990
Subject: Civilian Welfare Messages into Kuwait
To : All Amateur Radio Operators
From : Glenn Baxter, K1MAN via Bob Salow, WA1IDA

Radio Australia will broadcast personal voice messages into Kuwait. These messages can be recorded directly by telephone into Radio Australia or by calling Glenn Baxter in Maine. The latter path may suffer voice quality because of retransmission.

Only first names should be used for the addressee and the signature. No street or city addresses should be used.

The telephone number for Radio Australia is: 011 613 881 2222.

The telephone number for Glenn Baxter is: (207) 495-2215.

The Radio Australia broadcasts may be heard between 1300 and 1500 UTC each day. The frequencies used will be: 6060, 7205, and 9580 kHz.

"death: to stop sinning suddenly."

]beacons of all the local FM stations (a dozen or two).
]
What you want to use is the NTSC subcarrier (3.579545) from a network
live television broadcast. These are transmitted with Cesium clock
accuracy. Furthermore, phase detection at 84 meter wavelength is
easier to make accurate than at 5,000,000 meters (60 Hz) or
15,800 meters.

However, for most of the US, this is really not the way to go at all.
LORAN C will give you accuracies of a few hundred feet, with differential
accuracies much better than that. You can buy
a LORAN C receiver with RS-232 interface for about $300.00.
Currently, some parts of the US are in bad geometry zones, but this
is being corrected. Phoenix is one such area, but in 1-2 years, we
will have good LORAN C coverage here. If you couple LORAN C to
a digitized road map, you should be able to keep continuous track
of where you are. The FAA (worlds most conservative regulator agency)
is starting to allow LORAN C ILS approaches - this gives you a clue as to
how good it is.

By the way, LORAN C transmits on 100 KHz and is easily detected with
a resonant loop-stick and FET impedance converter. Build one and you
can see the pulse groups with a scope. Pretty neat stuff!

>Can you point me to any literature on LORAN? I'd like to learn more
>about it...
>--
>Ken

LORAN-C User Handbook U.S. Coast Guard, May 1980. COMDTINST M16562.3 Available from Supt. of Documents, U.S. Gov't Printing Office, Washington DC 20402. $7.50 (in 1983).

Covers the basics of LORAN-C and has maps and parameters for all the transmitter chains active at that time.

The Aviator's Guide to LORAN-C by John F. Good, Aksunai Press, Box 326, Wakefield MA 01880 (First ed. 1984. No ISBN. $12.00)

I bought my copy from Sporty's Pilot Shop but they now say it's out of print.

This is the best LORAN-C book I've seen, with excellent descriptions for technical and non-tech readers. Tells how to install receivers in planes and cars.

Chapter 10 is a fascinating history of hyperbolic position-finding. LORAN-A, the bane of the 160m ham band, was phased out (so to speak) in the early '70s. LORAN-B was LORAN-A variation which was never deployed. LORAN-D is a low-powered military tactical system which is compatible with LORAN-C.

The Wild Goose Association is a LORAN equipment manufacturers' group which is of little direct benefit to individual users.

LORAN-C is on 100.0000*** kHz; it's controlled by atomic clocks and can be used for a frequency standard. On audio, it's a rhythmic clattering sound like a motor with bad bearings. The pulse sidebands extend more than 10 kHz either side of 100 kHz.

LORAN (acronym for LOng RAnge Navigation) is lots of fun, and becoming more affordable. K-Mart now sells LORAN receivers for $329 (but you can get the same model by mail order for about $300; see boating magazines). Most receivers come with books which explain the principles.

LORAN has direct ham-radio applications: It's useful for determining antenna and repeater performance, since it constantly tells you the bearing and distance to any fixed location ("waypoint"). It indicates latitude and longitude, for ham activities where grid squares are important. Add an altimeter, and you have a 3-D fix.

The satellite-based GPS navigation system is superior to LORAN but there are not yet enough satellites in orbit to give 24-hour coverage, and receivers cost at least $3000 (predicted to reach $500 in a few years.

When buying a LORAN receiver, be SURE it contains the necessary firmware for using the new transmitters which are supposed to go into service this year. (Don't take the salesman's word for it.) Otherwise, it will need a ROM upgrade (maybe not available for used units no longer in production). See _Aviation Week_ magazine, Sept. 28, 1987, p.120 for info about the new stations, which will extend LORAN-C coverage in mid-USA and southern Canada.

>This receiver requires 3 signals to get a fix; is there
>any way I can do it with just two?

Two stations (master and one secondary) establish a hyperbolic line of position, i.e., you are somewhere along a curve some number of microseconds from the master station. To find where, i.e., a fix, you must have two lines of position and find where they cross. If you already know that you are along some known line, like an interstate highway, then you can plot a fix with only one set of raw LORAN numbers (microseconds), but is usually isn't worth the trouble. Before microprocessors were available, LORAN receivers indicated only microseconds, and you needed a special chart to plot position. When I use LORAN in my car, I sometimes use (for example, when travelling east/west) only the longitude readout for finding my position along a road. To calculate Lat or Lon, however, the receiver must receive three stations. Some super-expensive LORAN receivers for aircraft track more than three stations simultaneously.

TRAVELS WITH LORAN-C

by Frank Reid W9MKV

[published in _The Lowdown_ (newsletter of the Longwave Club of America), June 1985.] [Abridged in this posting.]

For two years, I've experimented with Loran-C for land navigation, including a perhaps unusual application, that of locating and recovering cave entrances and other karst features in dense woods in Indiana and Kentucky. The high resolution and repeatable accuracy have been adequate for finding very small holes in areas where visibility is 100 feet or less.

The Micrologic ML-5000 Loran receiver is highly portable and requires only 0.6 amp with its lights off. Within Loran's basic limitations, the device has been altogether satisfactory for automobile use, which must be a worst-case application. I've measured locations of 200-mile-distant road intersections on aeronautical sectional charts, and consistently had the waypoint-arrival alarm sound when within sight of the destination (arrival alarm radius set to 300 feet). I anticipated using my receiver for air navigation to supplement the ratty avionics in rental planes but the unit's size and shape make it unsuitable for

temporary mounting in small aircraft. The ML-5000's ability to store alphanumeric waypoint names is a tremendous advantage, eliminating the need to refer to a separate list.

Another Loran I've used, a II Morrow "Apollo" installed in a friend's airplane, has been disappointing, at least in my region. It does not select stations automatically, and requires special settings when in areas between transmitter baseline extensions. The baselines and extensions radiating from the nearby Loran transmitter at Dana, Indiana, make the II Morrow unit very cumbersome to operate when travelling in most directions. To alleviate the problem, my friend uses the Southeast Chain (which does not include Dana) instead of the normally-more-suitable Great Lakes Chain. The decrease in repeatable accuracy (300 feet instead of 100) is not objectionable for VFR flying but, as Indiana is a fringe area of the Southeast Chain, weak signals sometimes cause the unit to reinitialize in flight, an unpleasant experience. (Loran-C receivers require 2-5 minutes to acquire and track signals, and can do so in motion.)

Power lines are the major source of interference on land. Briefly driving under one causes no problem because the computer's position-determining process averages a large number of pulses. Driving parallel to a large power line for a mile or so can cause the receiver to lose track. It often becomes unusable in metropolitan areas. With the vehicle not moving, I have noticed large position errors (more than one mile) near power lines even when the receiver displayed no alarms. Power-line noise may have caused the receiver to cycle-slip (detect the wrong cycle of the Loran pulse).

While driving around Indiana on the first weekend of experimenting with my new receiver, it unexplainably lost track three times. I was then about 20 miles from the transmitting station at Dana, and decided to make a visit. Not wanting to risk preamp damage from strong signal, I disconnected the antenna 3 miles away. When I arrived, the Coast Guardsmen who man the station were too busy to give me a tour because the place had been hit by lightning and had been off the air three times in the last hour. They were using diesel-powered generators for continued operation at reduced output. The station is big! The antenna is about 600 feet tall, with a capacity hat of many long radial wires from the top. The Dana transmitter has 400-kilowatt output. Some Loran-C transmitters radiate up to 1.2 million watts.

I travelled through the "mid-continent gap" enroute to Wyoming in summer, 1984. Driving westward through Iowa and southern South Dakota, the repeatable-accuracy readout slowly increased to over 400 feet, and signal-to-noise ratios decreased but stayed within the usable range. (Decreased accuracy isn't a serious problem Out West where driving visibility is better than flying visibility back home! Sectional charts are a lot more informative than roadmaps.) Manufacturers recommend recalibration every 200 nautical miles, or after changing transmitters. Using an aeronautical sectional chart, I

recalibrated at a road intersection in SD, my first recalibration since Indiana, and was two minutes off in longitude but perfect in latitude. There were no problems until I reached the Black Hills region. East of the Black Hills, the Loran remained on the Great Lakes chain, changing to the West Coast chain a few miles west, but within the Black Hills geological formation, signals from both chains were unusably weak. In Wyoming, it "derailed" for about 5 minutes as I drove under a thunderstorm. The unit functioned perfectly during the return trip on I-90, passing just north of the Black Hills. It automatically switched back to the Great Lakes chain near Rapid City, SD.

Parts of the mid-continent gap are marginal, others are truly unusable. Unsuitable station geometry causes poor coverage in most of Texas, New Mexico and Arizona. On a trip from Indiana to Texas, my receiver switched from Great Lakes to Southeast chain in Arkansas, and became unusable south of Dallas, near a baseline extension with no alternative stations available. I tried manually returning to the Great Lakes chain, but the signal from Minnesota was too weak. It seemed to work properly near Austin, and became unusable again just north of San Antonio. Southeast Chain signal-to-noise ratios were good in Texas.

A fixed Loran receiver can be used for DX'ing; simply set the GRI of a distant chain, wait for the receiver to acquire signals (which can take an hour or more), and note the signal-quality indicators. R.W. Burhans' Loran DX'ing method (_Lowdown_, January 1985) is superior, allowing visual signal comparison, and reception without master-station acquisition. Household power lines interfere, and best results are obtained with battery power and a long wire antenna in an isolated location.

As a caver, I just _had_ to see if Loran works underground! Through affiliation with the Cave Research Foundation, I was able to take the pack-frame-mounted unit (with 3-foot whip antenna) through a large passage in Mammoth Cave, Kentucky, stopping at USGS benchmarks to check position. The average depth was 200 feet. Signal strengths varied enormously-- At many locations, signals from Dana (173 nautical miles away) remained almost as strong as on the surface but signals from New York and Florida were unusably weak, so fixes could not be computed. 100 feet of extra antenna did not improve signals significantly, nor was cycle-stepping successful. At a place where water enters the cave through a vertical joint, all signals were strong; the computed fix was 1/2 mile east of the real location. Part of the underground route contained power lines for lighting, which are in metal conduit and buried. Their presence or absence had no noticeable effect on Loran signals. The lights were not turned on. I have taken the Loran receiver into two Indiana caves, with similar results.

Although Loran navigation seems not to work underground, there are interesting effects worthy of study; a simplified 100-kHz receiver

could be used in caves to search for vertical joints, thin overburden or other anomalies.

Changes in ground conductivity cause local propagation anomalies, manifest as Loran position errors, near geological features such as sinkholes and escarpments, and probably faults and mineral deposits. Loran in conjunction with optical survey may be usable as a prospecting aid analogous to the ground-resistivity-mapping process but without the cumbersome wires and ground rods. (There are a number of geophysical techniques which use signals from U.S. Navy high-powered VLF stations. A useful reference is _Applied Geophysics_ by W. Telford, L. Geldart, R. Sheriff and D. Keys, Cambridge University Press, 1976.)

727. Drilling Holes

Newsgroup: rec.ham-radio
Date: 1990-08-29 16:13:01 UTC
From: Bob_Dixon@OSU.EDU
Message-ID: <CMM.0.88.651946450.dixon@hpuxa.ircc.ohio-state.edu>
Source record: 8937

Here is the method I have used with success. Drill a hole just big enough for the pilot bolt of a chassis punch, and then use the punch for the final hole of the correct size. That will make a very nice smooth hole with no paint chipping, etc. If possible with the antenna, mount a ball mount on the car instead of the antenna directly. That will allow you to easily change from one antenna to another as you wish later. Be sure to use a stainless steel ball mount, as the other el cheapo balls will chip, rust and permanently corrode onto your antenna.
The antenna or ball will generally have a rubber gasket where it meets the car, for waterproofing. I make doubly sure of the seal by coating the gasket with clear silicon sealant before final assembly to the car.
To get a good ground conection, use an electric drill (or something like a small Moto-tool) with a wire brush or small grinding bit, to clean off the Inside of the sheet metal down to shininess. The antenna or ball will have hardware that tightens up onto that bare spot and makes good contact. Then paint the entire area inside the car with 2 coats of Rustoleum rusty metal primer, to prevent future corrosion.
If you are mounting the antenna on the roof (the best place for maximum coverage), a good way is to take the dome light out and then work thru that area of the roof. Then put the dome light back in when the antenna is finished. That often avoids having to deal with the upholstery.

> you've used?

Brian,
Three commercial solutions come to mind. Microwave Modules still has
a 2M <-> 1296 transverter as far as I know. Probably fairly pricey.
The same is true for SSB Electronics (DM1200 or so I think for 10Watts).
A less expensive alternative is the Maki-Denki (sp) Japanese solution.
It runs about .75 watts output and the one I had showed 2-3 dB NF on
receive. I bought it for about $125 in Tokyo as I remember 4-5 years
ago. 100 mW drive is fine (too much?).
All the above are linear transverters and are usable (although probably
none is rock-solid stable) for SSB/CW as well.

10-20 Watt linear amplifier modules are available from (at least)
RF Parts in San Marcos, CA for under $70. A lower power driver is
also made by Mitsubishi which will put out the 1 watt or so needed
to drive the power amp. These low power drivers need only about 1 mW
drive and I think can actually do about 4 watts saturated so they
make pretty good modules in their own right. I think they are about $40
or so.
If you get into building your own transverter, you might refer to my
microwave station design series in Ham Radio Magazine for a fully
phaselocked LO system. Sounds like the commercial route is likely more
to your liking at this time though. See if you can get someone in Japan
to get a Maki-Denki for you. The latest JRRL CQ Ham Radio has the
UTV1200 in it (I think that is the correct series, I don't read Japanese
I just look at the pictures (:>)) from Yen39,000 to Yen49,000. Looks
like one of these is 3.5 watts output. I'm reading from page 201 of the
September issue in case you can get a copy to someone who can read it for
you. There are probably some other ads for it elsewhere in the issue.

Subj: Pirate TV

I've seen DAK's advertisement for the wireless TV system. The posting brings to mind another *distinct* possibility. Ponder this ad:
GET ON THE AIR WITH OUR NEW COMMUNICATION SYSTEM

The Federal Communications Comission recently lowered the rerquirements for obtaining a license to use the Amateur Radio frequencies. The ability to copy Morse code, which has been a major barrier to obtaining a Ham license, is no longer required by the FCC. In a celebration of this momentous event, we at Starcracker Radio are offering this blockbuster special so you can be the first on your block to get in on fun of being a Ham. Starcracker-1 transceiver, 50 watt transmitter works on all Ham bands from 14 MHz through 30 MHz. Only $79.95. Starcracker 1A same as the Starcracker 1, but works on Ham bands from 30MHz through 150 MHz only $109.95.

Why be power-limited? Why skulk around on 11 meters wondering if you'll be caught running illegal power? Our new StarCrusher-100 will give you 100 watts of power that you can LEGALLY use to talk nearly anywhere in the world! Only 139.95. Or, for more talk-power you can key up our StarCrusher 500 to blast through the QRM. This fantastic radio is on sale now for ONLY 199.95. But don't wait! Act now while supplies last!

Best of all, ALL our radios come with an easy-to-use exam outline. All the questions you'll see on any license exam will be right there for you to study, and the CORRECT ANSWERS are right there with the questions. You'll also receive easy-to-follow instructions on how to find examining stations and what you need to do to get your license. DON'T WAIT! DO IT TODAY!

I've been waiting for Tom Clark or Courtney Duncan to verify the schedule,
but since they haven't, I'll leap into the breach.

Yes, the times should still be fine. (The METs, that is; as Vince noted,
the actual times may shift slightly depending on actual launch time.)

And yes, the "demos" are still very much on. I don't know why they're
called demos; to the kids who will be talking to the shuttle, they're
very real!

Regarding the following comment David made in his original note...
One notable exception...to get the 28a/h to xmit out of band, you just cut D21...no matrix programming change required. It's a different design, and it's easy to see what's happening in the schematic. Oh...and there are two D21's in the 28a/h...get the right one...the wrong one is in the backup battery circuit and clearly has nothing to do with the transmitter portion.

QUESTION... Is the IC228H the same as the 28H in this respect??????????

[deleted some more]
> Rich experimented with all sorts of modes. Why am I saying this?? I consider
> Rich MY Elmer... He gave me alot of support and help. He hated it when
^^^^^^^^^^^^^^
This has me perplexed.... I often consider Doug to be MY elmer!?!?!?
He was licensed well before me, and I have fond memories of trying to squeeze
into the Ham shack (is was in a small closet) in high school while Doug was
operating CW on the Novice bands... and I was always asking:
Who is that???
Where are they???
What are they saying??
and other such anoying questions!!! Thanks for the fine memories Doug, they
are still with me, and I still think of them as fond memories!!

Well, I have to say a personal thanks to Doug, he has to be considered one
of the persons most responsible for me getting my 'ham ticket' and getting
on the air... THANKS DOUG!

Ok, on to the CHALLENGE (I thought that I should be allowed to contribute
also!)....

Don't ever listen to anyone when they try to tell you about all the fancy
equipment that you need for various Amateur Radio activities. Ever since
I was first licensed (not that long ago :-)), I have had a sort of
romantic desire to be an active OSCAR (Ham Satelites) operator. There is

just something about communicating through an orbiting satelite that is in OUTER SPACE via Ham radio that has attracted me. Maybe it is all those 'Lost-In-Space' and other 'Sci-Fi' TV shows that I watched as a child, or watching the Apollo missions from the living room.

Well, I spent a considerable amount of time reading, and studying about the nessesary equipment to 'work' the 'birds'. I thought that I would never get on the air! The 'books' told you that you needed a steerable array (gosh, that sounds expensive).... two rotors to not only point in the proper azimuth, but also an elevation rotor to point the antennas in the proper place in the sky! Of course, one also needed antenna's to point, and then the radio gear... SSB or CW transmitter on 145MHz plus a 29MHz receiver....

To shorten this story, and get to the point. I was comming to the conclusion that I would probably never get 'on-the-air' as far as OSCAR was concerned.... all that complicated stuff, and all...

... one day, I was tuning through 10 meters around the high end of the band... the whole band had been very dead... I don't know what I was looking for... then all of a sudden, I heard all kinds of signals.... everyone I heard was working other stations!!! And I could hear them ALL!! At first I couldn't understand what had happened. The band had been dead. Maybe I have an intermittant connection from my antenna, and that is why the signals just seemed to 'pop' in out of nowhere.... I finally realized that I was hearing the output of one of the OSCAR satelites (hearing people calling CQ OSCAR, CQ OSCAR probably gave me the hint!!). I sat there, longing to be on-the-air with them!

At first, I thought that I would just sit there and listen, If I only had a transmitter.... even a simple 145MHz CW transmitter would be great!!! Just then, someone started using one of the local 2 meter FM repeaters, I reached for the knob on the FM radio to turn it OFF... Then (EEK, I get strange thoughts sometimes (no comments from Doug!).... My FM rig can transmit in the proper frequency range!!! Of course the OSCAR 'birds' don't like FM being transmitted through (I have been studying, so I knew this)... BUT, I could get a scrap of wire.... disconnect the microphone... and use the PTT (push to talk) line to key the transmitter and have a CW signal on the air!!!

I set the transmitter to a frequency that I thought should be near the middle of the input of the satelite... and started calling CQ by shorting that wire across the mic-plug of the FM rig.... then I heard it!!! My own signal heard through the satelite... I didn't care if anyone heard me, I heard my own signal.... Of course it took me a little tuning to find it... but there it was. I wonder if I can send a QSL card to myself??? with them...
Just then, someone answered me!!! We had a great (short) contact, and I explained what I was using.... a 10 Watt 2 Meter (145MHz) transmitter into a 1/4 wave ground plane antenna... my receiver was an *old* Heath tube (HW-100 I think) job, and it was connected to a 10 meter dipole. I did receive a QSL card from the other Ham... It is one of my favorites!!!

Sorry for the long story... I had fun remembering it (that was back somewhere around 1978 or so).... The moral of the story....

Have FUN with Amateur Radio.... Fun like this is stimulating and doesn't have to be expensive... It also prepares us for the emergency and public service that we perform from time to time.

> PS: Still think I got the remainder of the 2mtr quad somewhere !!

Great!! that was a lot of fun too (another story), I was almost thinking of building another one!

By the way... how are we going to answer the question about who elmered whom?

Rich (NM1D) -- And PROUD of it!!!!

Source record: 8971

I opted for drilling the hole, because I heard that mag mounts are prone to vibration and can scratch the paint, causing more damage than drilling a hole. If you want to sell the car, you can buy a little rubber plug. If you are drilling a BMW or a Porsche, then you obviously make enough money not to worry about such matters.

>73, Dube N5PDK

My definition of a ham techie is someone who is more interested in the techincal side of radio than in operating. In general, a techie is a builder not a DXer. A techie likes novel circuits or software not making the BPL. A techie operates primarily to try out his/her new ideas or to talk about them. A techie will rarely be found hanging around the "good ole boy" roundtables.

An ultra-techie is so far gone he/she won't even talk to the techies. :-)

To become a techie you only need a burning desire to learn and do.

Just to add a note of levity: I have a mag mount 5/8s 2-meter whip on
top of my pickup truck. I drilled a hole in the roof, though, so that
I wouldn't have to feed the coax through a window.

Q: Why did I go this way?

A: Lots of reasons -

1. I can move the antenna to another vechicle easily (and
only leave a few scratches :-)

2. I can run it on the roof of my house (sheet metal roof)

3. Truck roofs are *tall*. I am sure that the 6'6"
clearances in mall parking lots & c. would scrape off
a hard-mounted antenna. The mag mount just tips over.

4. The measured SWR is 1.1 to 1 or better, so I can't
get too excited (pun) about efficiency arguements

5. I don't have to listen to the wind noise created by always
having a window cracked open.

I just picked up a disc-cone for the house, though, so #2 isn't
as much an issue now as it once was.

Packet radio in the CB (11 meters) isn't a new idea, I played with the idea a bit with a friend.

Things to think about: Time limits (if you want to operate legally)

Problems: NOISE....(Donno what the hell it is, so lets key on it!)

Besides, most CBers lack the intelligence to run a radio AND terminal.

(Sometimes it seems like running the radio is hard enough for them, with the 3 hour long conversations about VSWR and grounding...)

B&W and color transmissions use the same frame rate 59.94hz. In the
beginning, B&W was transmitted with a 60hz frame rate, but since the
advent of color, the broadcast standard (RS-170A) sets the frame rate
for all transmissions to the color rate of 59.94hz. The color subcarrier
and the color burst are deleted during B&W programming to prevent
false color on misadjusted receivers.

The frequency/phase of broadcast images can change from source to
source although most modern plants lock all their sources together
to allow supers and special effects. Unfortunately, very few stations
use high stability references for their plants. In the past the networks
used Rubidium frequency standards for their feeds and some stations
installed these "atomic clocks" locally so they could stay in phase
with network programming. This allowed them to super their call letters
over network programming. Today however, with the advent of cheap
digital framesyncs, the stations run off their primary reference all
the time and resync incoming feeds to their house reference with the
framesync. This means that the stability of the signal is reduced to
that of a simple crystal oscillator, often not even temperature
controlled. The use of cheap digital equipment has allowed the
frequency tolerance of reference systems to be relaxed so much that
the FCC no longer even requires that we monitor our reference frequency.

This is not the worst problem with your scheme however. The problem
is that stations are not in frequency/phase with each other. What
you would be measuring would be the short term drift between two
or more totally unrelated crystal oscillators. If all the stations
in a local area could be PAID to keep their plants referenced to

a common reference, then you would have something.

FLAME WARNING !!!

When I am misquoted or misinterpreted, I take the privilege to FLAME !!!

> No, I'm sorry, it's stupid and not well thought out. It was stupid and not well
> thought out when Phil Howard proposed the same thing last year. Who the hell
> are you to tell me that I need a note from some overbearing old fart that says
> I'm *allowed* to have a radio because I'm being supervised? Beyond that, what

I did ***NOT*** propose the same thing last year. I suspect you did not really read exactly what I said and the context it was applied to, because I received a couple of private replies from people who misinterpreted it like you are doing.

THE CONTEXT WAS: there was a proposal to have the FCC restrict transmitter sales. This resulted in many threads of argument.

WHAT I PROPOSED: was one of several alternative plans, including adding that *IF* there must be such a law, there SHOULD BE A CLAUSE to allow the scheme of having the elmer or some other ham sign for candidates.

There was also an alternative that I suggested of asking the dealers for voluntary enforcement. The flames I got back from that were **COLD** because the "flamers" assumed I was proposing the idea from the context of where we are now when in fact I was proposing it as an alternative to a bad idea. They assumed, as perhaps you also did, that I was coming up with that idea because I wanted to see it done when in fact it was to cool down the ideas of having the laws that were proposed.

It ABSOLUTELY DOES **NOT** mean that I like the idea. Some people have an attitude problem when it comes to ISSUES: they are UNABLE to deal with things in forms similar to: "I don't like X, but if we have to have X, we also need to have Y". The no-code issue falls into this. But far too many just said they were against it (many without any logic or reason) and failed to put in their position when it came to figuring out what a "no-code" really was.

If fully support the right for people to OWN:
GUNS without a license
CARS without a license
FISHING RODS without a license
TRANSMITTERS without a license
ANY CHEMICAL OR DRUG without a license
and for anyone to make or manufacture for themselves any of the above.

> I know you're trying to come up with a solution to something you percieve to be
> a problem. I don't believe it is as big a problem as people who like to worry
> about it wish it were. In the only instances above where you cited licenses

> that are supposedly proof of ability to operate (cars and airplanes), there is
> no precedent for making a license required to buy the item whose operation is
> restricted. It is illegal to operate a ham transmitter without a license. The
> FCC *is* prosecuting cases where unlicensed operation takes place. There is no
> need for a "fix" that will open up a whole rat's nest of liability problems and
> make it even harder for new hams to join up.

Now if you had posted some of these issues back then, it might have been made clearer now. I just don't like being taken out of context.

If we need to require a license for anything, it should a license to reply to something you misinterpret (just joking, I support your right to post whatever you want, but I will rebut if it is wrong).

> (I wasn't in the callbook. If you're current in the callbook, they'll look
> you up. I just faxed a copy and that was that.)

PC Electronics has a right to do this if they want. It does not influence my
decision to buy or not buy anything from them. I currently do not because
what they sell isn't the kind of equipment I want to buy.

> -Incidently, there is no reason an
> -orginization with a business license can't buy ham gear and have it
> -modified to use on their assigned frequencies, and use it.
>
> I'm not sure, but do radios have to be type accepted for business use?

The FCC requires (as far as I know) ALL business uses of radio to be LICENSED
and make use of equipment that is TYPE ACCEPTED for that particular service.
The key words are "make use of". The FCC (apparently) has no authority over
what is actually owned, and has only limited precedent for equipment sales
(e.g. CB linear restrictions).

People who modify their transmitters for "out of band" that covers the land
mobile services have not broken any laws I've ever read. But to USE them on
those services, even though they are properly authorized (e.g. a police officer
who is a ham, and is using his modified ham HT on his authorized police radio
frequency) is a violation of the use of type-acceptance rule.

While I have no first hand experience, I have been told by several folks that they've seen poorly constructed Astron supplies. One fellow found the AC line wired backwards while yet another found an area that missed solder completely!

Is it possible that maybe you've got a marginal connection in the supply?

DISCLAIMER: I'm NOT badmouthing Astron. I'm just relaying comments I've heard in the last few weeks regarding their assembly.

Gary (N9KAW)

I have an Astron (and schematic) at home too. So this *is* a guess.
I suspect that you could easily have generated some pretty big local
fields with the tuner and the longwire. The impedance of the longwire
could certainly have been high and that probably made for lots of
RF voltage in the shack. Whether this was coupled into the Astron via
the DC output leads, the power line or directly radiated into the
box I don't know but it probably was one of those. The source impedance
of the supply at RF is not guaranteed to be low (thus the extra bypasses?).
I don't know what the failure mechanism was exactly but I think it
is a series pass supply which means that the output might be pulled
above the desired regulated voltage. I suppose there is an overvoltage
circuit which could have turned on. I'm not clear on what the precise
failure sequence was but maybe there is a crowbar that got turned on
and the supply tried to source current into it and broke something.
With the RF present in regulator, over-voltage and over-current circuits
it seems like almost anything could have happened.
I hope it didn't over voltage your radio. I fried a 432 transverter that
way one time and I know of others who have lost HTs to the same fate.
Good power supplies are *not* trivial.

Regarding Drilling holes in your car:

Don't use a PL-259 (SO-259) on your car. Go buy a Larson (or your favorite manufacturer) antenna base and the mating antenna of your choice. There is a complete set of instructions included with the unit. As another poster suggested drill a pilot hole first and then USE A CHASSIS PUNCH to make the appropriate size hole. This will make a clean ROUND hole of the correct size.

The Larson mount has a square steel inside piece with the corners turned up. This will spring a small amount and scrape its own contact to the bare metal (this on the inside of the car). For the outside there is a moulded, threaded cap with an O-ring seal to fasten to the inside piece. The result is a neat water tight antenna mount that you can buy different kinds of antennas to fit (like when you buy a dual bander and think you need a new antenna). For my own installation I use a 1/4 wave 2m antenna for normal commute use. When about to go on a trip I swap the 1/4 wave 2m ant for a 5/8 wave 2m ant to get better range.

For the faint of heart, look in the Yellow Pages under mobile radio. Find a local dealer and have them take down the head-liner, drill the hole and dress the coax cable. Check with them first, their antenna product line may not include what you need, you may be better off buying the antenna first and having them install your antenna. Last time I made the inquiry the price was less than $50 and it included the antenna and coax.

Regards, Dave

> ...challenge to say something *good* about our hobby.

Last Sunday evening I backpacked into the Boulderfield, 12800', north of Longs Peak, Colorado, 14255', as the Park Service was evacuating an injured climber from the north face. They were unable to reach a flat enough area by dark for helicopter evacuation. The chopper made one pass and bugged out due to erratic winds. It was 9pm, eight hours since the accident, six miles and 3400' down to the trailhead, and the guy was still bleeding slowly but uncontrollably from a compound fracture.

I offered assistance with my 2m HT. The EMT in charge decided he needed to converse directly with a doctor. That was hard to arrange with the Park Service HTs. I made a phone patch with 1/2 watt via line-of-sight to a repeater in Fort Collins, 35 miles away and 7800' lower, thence called back into the Estes Park Medical Center about ten miles away from us. The EMT and the doctor had a productive conversation.

Due to unpredictable winds, the rescue team elected to carry out the victim that night. At 6am the next morning he reached an ambulance at the trailhead, about 17 hours after the accident, and was in surgery in Loveland about three hours later. The next day he was doing fine (I visited him briefly); recovering from blood loss and beginning the difficult road to recovering the use of his right leg.

Oh yeah, during that same two day backpacking trip I also helped two parties call in to report they would be late getting off the (notoriously long) trail, helped someone say Hi to their grandmother in Denver, called the Colorado Mountain Club peak register coordinator a couple of times to pass information about register conditions, and kept in touch regarding my ex-wife's sudden overnight stay in the hospital. (We have a seven year old daughter...)

How'd I ever go into the backcountry without a radio?

>
> Amen to that. I've especially noticed that in the past few years. I'm
> not sure what you mean by "rice-rockets"[sic], but it seems like the
> newer HTs tend to have a really high mike gain.

This is a perpetual problem. The trouble is, the guy with the problem
is the only one who *never* knows about it because he is transmitting--
everyone *else* has to listen to it.

To further complicate matters, many radios have both a microphone gain
and a deviation limiter adjustment.

The microphone gain generally sets the gain of the microphone amp
stage, which in many cases nowadays is a monolithic chip containing
an op amp or two. The mic gain determines how much audio will be
shoveled at the deviation limiter circuit. Set this too high and
you will be limiting the road noise to same level as your voice
at screaming volume = no good! This should be set so that you
just barely limit the louder peaks when speaking in a normal
communications level voice. Watch out for the touch tone level;
the IC-2 has a separate adjustment for the tones while some radios
do not. You may have to monkey around a little to get the tones
and voice balanced on such radios.

The deviation limiter attempts to prevent splatter by limiting the
modulation index. It generally performs minor audio shaping and
limits the amount of drive to the modulator circuit. This adjustment
keeps your signal roughly within the +-5KC bandpass of most receivers.

Note carefully: you can set your mic gain all the way up and your
deviation limiter to near bottom and end up with a horribly distorted
audio signal which is barely audible; you can also set the mic gain
very low and crank the deviation limiter way up so that in order
to be heard, your signal will splatter out of the bandpass of the
receiver.

The best thing to do, again, is to adjust the mic gain for a wee
bit of limiting at normal communications speech, then set the
deviation limiter on a calibrated monitor to the 5KC range; this

will give you a punchy audio signal and give the rest of your
listeners's ears a break!

Thanx in advance.

SuperMorse 3.x (I think version 3.09 is on SimTel20, I have 3.15 from
Compu$erve, and have not checked lately for updates) is a fine program
by Lee Murrah, WD5CID.

It has been able to send code from a file ever since version 2.xx and
before that it was called "CW" it still sent from a file.

Rich Bono, N1MD, who reads this newsgroup, has a good one called AUTOCW, which
I think also will read from a file.

It ain't hard in the DOS world to read a file, and any code program that
-DOESN'T- just isn't finished yet! :-)

>can see the pulse groups with a scope. Pretty neat stuff!

However, most loran-c receivers use voltage-probe antennas, and are quite susceptible to man-made interference, such as arcing neon signs, fluorescent lights, electric fences, and unshielded ignition systems. The one I run in my car often fails to lock up with a verified position. A magnetic-field antenna (big ferrite rod) would eliminate most of those problems, hence my question a few weeks back on this group as to where to find big ferrite rods.

One interesting thing you'll find if you start having an accurate nav instrument in your car: a lot of the roads aren't exactly where the maps show them to be. Some are off by a tenth of a mile or more out in the middle of nowhere. (I can't help but wonder if that's just plain simple error or whether the Defense Highway System isn't where the maps show it to be in order to make bombing it harder!)

I need information on Bendix King handy-talkies, I know the basic programming of them, and some modes, but not as much as I need to know.

It's a govt bander, but in theory, it'll work in 2m as well, and I know it will operate at least as high as 170Mhz, and low as 155Mhz, and will store (but not always accept/operate with) values as low as 101Mhz.

What I need is a information on "secondary programming mode" and I need to know the meanings of options 1 - 12345 and 2 - 12345, as well as involk dtmf mode (Little Phone Reciver on display).

Why: A friend of mine is a Chief in a Vol. Fire Department in Minn., and they got 4 of these with chargers, and no paper from another city in the midwest. They have no cellular service, but do have 2m repeaters/ phone patches, and has to carry this radio whenever he's on standby, the radios have 14 channels, but his area only uses 8 for everything, including fire, law enforcement, etc... He's a ham, but doesn't own a HT of his own. So right now, the only extra feature he's added is NOAA weather (with scan bypassing, for good reason).

I have no model number....

...Don't ask, that's about all the info I have, just spent some time on the phone explaining how to trip prog mode, and some basic programming features (all I know about the bendix king). So I figured SOMEONE out there knows...

ISTM that this is no longer true.
In times past, every station ran genlocked with the network.
But with digital time base correctors, and all the other new
trick-or-treats available, this is a thing of the past.

Any TV bcst engineers out there to confirm/deny/flame/yawn ??

> [I mention how simple the 28a/h xmit out of band mod is]

>QUESTION... Is the IC228H the same as the 28H in this respect??????????

Maddeningly, no. The 28h is ridiculously simple, and the 228H is ridiculously complex. In fact, I have modified two 228H's and they weren't even the same as each other! They must have changed the design subtly without announcing it. Anyway, it's hackable by the means I mentioned in the last article, and with enough digging I might find where I wrote down the mod, to save you some time.

To give you some idea, the diodes in the 228h are the tiny one-or-two-to-a-three-leaded-surface-mount-device variety, mounted beneath the backup battery on the circuit board immediately behind the display panel! To do the mod it is necessary to remove the backup battery and carefully install (I think two) diodes.

The 28h requires only clipping one wire. Oh well, that's progress!

>(assuming dish or horn antennas), you might be a little less concerned
>about the content (go ahead, send rec.humor) - not that I'm endorsing
>this of course.

Sigh. The troubles are:

1. I only want to achieve 19200 baud. I have to either hook this up
to the ethernet port, which seems problematic, or a serial port and
run slip, which is the prefered solution, IMHO. Therefore, I
want to get two "black boxes" with RS-232 ports that look
like a 3-wire RS-232 cable: Full duplex bitstreams.

2. I live in a condo. The best I can do is MAYBE a 5 element loop
beam. I'd like to get away with even less. However, the OTHER
end will be two stories up, and can have as good an antenna
as I want. The antenna will be near some trees, but it won't
be in jungle-type foliage. The terrain between there and here is
flat as a pancake. If I could get to the roof at my house,
I wouldn't QUITE be line of sight, but pretty close.

>Or maybe use unrestricted frequencies - visible or IR light. A couple of
>pairs of binoculars with light emitters (LEDs) and photodiodes at their
>foci might make a dandy full-duplex link. The antennas are the right
>size :-) I've always wanted to try this out but never find the time.

More than 5 GHz is right out, unless I can get a very lucky bounce.
I have one idea: My bedroom window is 20 feet from a telephone pole.
A wire to this pole is not possible, but how about a dish aimed
out the window towards this pole (there's a garage between the window
and the pole :-( ), and a dish on the pole with nothing attached
to it -- using the dish on the pole as a passive reflector? I'd have to
do it at night, but with help from a couple friends, I bet I could
get the dish just below where the real cables are, and I bet the
phone and cable companies would leave it alone. Would THAT work?
The pole is almost 180 degrees off the bearing to the other
end. What happens when you put a glass window in front of a feed horn?
Bad things, I trust.

I wouldn't be so paranoid about putting an antenna outdoors, but I used
to be on HF, and that got all sorts of attention. I am definately
being watched. :-)

Life gets complicated, no?

On a partly related note: Is my "44" TCP/IP address good on
the rest of the internet? Should I ask for two "44" addresses
when I get on the internet: One for the SLIP, the other for the KISS?
Or should I just keep it simple and get an address from my
internet feed's zone (they have 3 nodes on a class B. Stupid) for the
slip, and use the "44" for the KISS? (the IP address assignment
hasnt' come through yet, but it will, of course, start with "44").

I must tell you a story about a radio hobbyist friend of mine that we call the "can man". How many CAN's can you find in this picture?

When I first met him, he was demonstrating the beautiful tube type 60W AM broadcast transmitter he had crafted. It was connected to a CAN-tenna dummy load. A walk around to the back of the rack revealed that the final grid tank was shielded with a coffee CAN, complete with a tiny hole for the neutralizing capacitor.

Next he showed me some other device he had made...I think it might have been a receiving converter. Anyway, the circuit was constructed entirely inside a coffee CAN, with coax connectors mounted to the lid.

But the kicker was when he showed me his homebrew 40M CW rig ... his code key was a bent coffee CAN *lid*, which you could tap against a nail in a piece of wood! Don't laugh...we worked CANada easily!

David,

friend of a can radio operator

Back in the 70's, K7SS and K7RA had a program on KRAB-FM (107.7 MHz, founded by the infamous Lorenzo Milam of "Sex in Broadcasting" fame) in Seattle called the "Ham Radio Hours". Actually, it had little to do with amateur radio, other than the show was amateurish and the hosts were hams...

They did a lot of wild stuff, and a couple of times they announced that "the MUF is up", called QRZ, and turned off the carrier while they "tuned the band."

Antenna fixing; go drill a hole! Having played with mag-mounts and hatchback mounts etc. i eventually bit the bullet & got out the hole saw.
Some magmounts have an annoying tendency to 'walk' across the roof on long journeys (my 72MHz 1/2 wave whip would crawl from the center right to the edge of the roof after 200 miles at 80-85MPH). With proper mounts, no problem.
I fitted one through the roof (using the dome lamp as access) and one in place of the broadcast-band antenna on the rear panel. The roof mounted antenna base is fitted with a square reinforcing plate behind to stop metal flexing; the other mount is on a panel that is sufficiently curved to be quite rigid enough for VHF antennas without any reinforcing plate.
If drilling holes, make sure you know whats behind; Its so easy to go through wiring looms, or break through into a double-thickness panel with no access. I have even heard of people finding where their gas tank was with the end of their drill bit. If in doubt, leave it to the professionals..

we hams use it.

>
>Things to think about: Time limits (if you want to operate legally)

What time limits?? I don't see how anything can be considered illegal
if you use an un-modified CB rig. You are still just running AM/SSB
and the sound of packet is no more illegal than all the wolf-whistles
and other noises Cbers like to make.

>
>Problems: NOISE....(Donno what the hell it is, so lets key on it!)
>
>Besides, most CBers lack the intelligence to run a radio AND terminal.
>
>(Sometimes it seems like running the radio is hard enough for them, with
>the 3 hour long conversations about VSWR and grounding...)

I sent a private communication to someone about this subject and my rationale
for even suggesting it. I suppose being as I made the statement in public,
my clarification should probably be public as well, so her goes.

Actually, I thought it might even clean up CB after a while.
Just think. Joe CBer hears this noise (brapppp) which he considers
annoying, so in the true spirit of CB, he tries to jam it by keying
up his rig and shouting obscenities into the mike.
Of course when he un-keys, he again hears brappppp. Eventually
the packet traffic gets thru cause it just keeps right on trying
and because packet users don't usually sit there with the speaker on,
they never even hear Joe CBer. But Joe CBer has to continue to listen
to brapppp brapppp brappp. How long before Joe CBer gets fed up with
the whole thing and puts his CB in the attic where it belongs??

The end result being, we might finally have a license free band
(remember Don Stoner's proposal) for all the computer geeks who
want to link conmputers and send traffic that is no legal over
HAM Radio (like USENET). Add to that the cleaning up of CB and
it sounds like a pretty worthwhile idea (IMHO).

Hmm... Well, you can try the US Coast Guard... They have a group based
in Wildwood (NJ or NY, I can't remember which) that does a lot with LORAN.
Or you can contact the "Wild Goose Association".... Or (I don't know how
helpful they will be) contact Megapulse, Inc., (Bedford, MA) 617-275-2010....
They make the SOLID STATE MEGAWATT (yes that is MEGA not milli or kilo)
LORAN transmitters... and have been very dedicated to LORAN. Although,
they are an engineering group... I don't know if they will be able to help
you at all....

Getting your recevier to give positional information with only two receivers
is fairly complicated.. and the capability must be built into the tracking
software of the receiver.... Some advanced receivers have this ability,
I think they call is "Rho-Rho" tracking, or some such thing... (Sorry, it
has been a few years since I worked there.... and I didn't work in the
areas of tracking software.

By the way... it is amazing how many Hams still think that LORAN is still
wiping out the 160 meter band.... This is similar the notion that the
Amateur Radio Service has lost the WHOLE 220 MHz band to the 'commercial UPS
boys'.... (I heard that one on a repeater this morning)... Geesh guys,
WAKE UP!!! LORAN has been on 100 KHz (oops, don't want to get flamed, make
that kHz) for years now (and the old LORAN A that caused trouble on 160 has
been OFF THE AIR FOR YEARS)... and (if we lose) we will only lose the
220-222 MHz segment of the 220-225 MHz Amateur band (for those who can't do
the math... that leaves 222-225 MHz (3 MHz) for Amateur Radio use).
[sorry for the rambling again.... I havn't had my coffee yet :-)]

771. Call Plates

Newsgroup: rec.ham-radio
Date: 1990-08-30 13:38:00 UTC
From: lwrclmr@SACEMNET.AF.MIL
Message-ID: <9008301339.AA28501@ucsd.edu>
Source record: 8903

For CA:
It's obvious that CA DMV offices are not with the program since by various postings here, CA call plates can cost anywhere from about $17-25 and sometimes, but not always, require a one time processing fee. Typical of most state bureacracies.

For OR:
I got my call plates in 73 and have transfered them around ever since. initially, I paid a one time 'transfer of registration' fee of $5 each time I transfered the plates to a new vehicle, then paid the regular $20.00/two years fee (recently gone up to 30.00). I did the paperwork at the local DMV office. At the time I got them, you could only get the 7 call area on your plates. I don't know if that is still in effect or not. An interesting note: when I first applied for my plates, I asked for amateur call plates. The clerk was confused for a minute, then told me I could only get ham callsigns on plates. He wasn't aware that ham and amateur were the same. He went on to explain that the law specifically prohibited CB call signs on license plates, even the vanity ones ($60.00 extra per year). Once I convinced him ham and amateur were the same, all was well. They gave me a temporary tag and I got my call plates about four weeks later. Every time I go into a new town in Oregon, the cops always run my plates because they quit making that color of plates in about 75-76 and they're now on an 86 van. What fun!

For MI:

All states are different. Here, the local Sectretary of State office handles registrations for vehicles, however, not for ham plates. you must first register your vehicle in the normal way, then call the state office in Lansing and request an application for ham plates. Fill out the application and return it with a copy of your license. They will send you the plates and bill you the regular plate rate plus a two dollar processing charge. You then take your old plate to the local office for a refund of that plates fees. After that, you renew it yearly just like normal plates. Michigan has no restrictions on call areas. Now I have two vehicles one with Oregon plates and one with Michigan plates, both with the same callsign. (I can keep the OR plates since I'm in the military). More fun!!

73,
Michael

This used to be true John. The networks quit doing this some time ago. Our NBC network feeds are hot switched via satellite from one location to another by uplink command from Skypath. None of the feeds are referenced to each other. There is a Frame Syncronizer as part of the NBC downlink package at each station. The incoming net feeds are resynced to the station's house sync generator by this frame sync. The house sync generator in most stations uses a simple non-temperature compensated crystal oscillator. It is not unusual to see a 10hz variation in subcarrier frequency from feed to feed and from station to station in a market these days.

> Gary (N9KAW)

This is a common problem with regulated supplies. Especially with
long wire antennas, it is common to see RF voltages in the hundreds
of volts floating on the equipment. This is where having an effective
RF ground on the station equipment saves the day. The Astron 35M has

some RF suppression builtin. There should be a .001 cap across the output terminals and one across the 110v line along with three MOVs. Also there are three caps surrounding the pass transistors. Check that these caps are there and are good. I recently had a lightning strike come in and vaporize the cap across the AC line (and the MOVs). Interestingly all four pass transistors survived, but the .01 ohm 5 watt emitter resistors didn't. These act to equalize the current between the pass transistors AND act as the metering shunt. These proved impossible to get locally. One foot of number 20 wire has .01 ohm of resistance and works nicely as a replacement. You may have blown the LM723 voltage regulator in the supply with high RF voltages. It can only stand 35 volts. Try replacing it (use a socket) and be sure to check the caps and establish a good RF ground before tuning up again.

From: brian@ucsd.Edu
Message-ID: <18154@ucsd.Edu>
Source record: 8906

I don't think I've explained this before in this group, but there are several difficulties in the way of using ham radio to connect to the internet. In no particular order:

1) The CATENET structure of the internet requires that there be a single logical gateway between two networks. This implies that a network is fully internally connected; the AMPRNet is not.

2) Lacking a fully internally connected network, only one of the clusters of hosts could be connected and the others would NOT be connected, but there is no way to advise hosts attempting connections to network addresses except to return "host unreachable" ICMP messages. Since these do not contain an "expected return to service" timestamp, it is not possible to advise that the condition of unreachability is a PERMANENT one.

3) There are legal restrictions in the USA that prevent packets not originated by hams from automatically keying a ham transmitter for transport to your station. Other countries lack third-party agreements that would allow them at all. Complex schemes of authorizing transmissions might make this legal but they would be cumbersome and cannot be guaranteed.

4) There are content restrictions on ham radio transmissions which probably require manual screening of content. Unrestricted packet exchange between AMPRNet radio-based hosts and the rest of the internet could well run into this restriction.

However, all is not dark:

You could apply for a class-C internet network number assignment from the NIC to avoid problems 1 and 2 above, and devise some remote control and filtering gateway to avoid 3. There are people who are doing this in various places; I suspect to some extent they are relying on the FCC simply not catching the occasional slip they may make. Probably they are right: it's almost always easier to obtain forgiveness than permission.

776. DC Adapter for FT-470?

Newsgroup: rec.ham-radio
Date: 1990-08-30 16:42:28 UTC
From: trop@hls.com
Message-ID: <9008301642.AA04515@hls.com>
Source record: 8879

Hello again, netlanders! Today's question has to do with my Yaesu FT-470 and mobile operations. I presently use Ni-Cad packs for power when I'm mobile, but I really would like to get power from the car instead. I understand that the adapters made by Yaesu only allow radio operation at the lower (2.3W) wattage.

Has anyone ever seen/used a DC adapter for the 470 that allowed operation at 5W

>
>What about: kilo-ohms
> kilometers etc.
>

Proper abbreviation of units is defined in ANSI Y1.1-1972 and ANSI/IEEE Std. 260-1978. A brief summary of the units in question are:

The letter K:

Use a lowercase k when the letter is the prefix for kilo or 10^3.

e.g., kW, kHz
written out, "kilohms" is correct

Use uppercase K when you are expressing the number 1024.

e.g., 64K bytes or 64 KB

Another basic rule is use a space between a two or more letter abbreviation and the number, but not between a single-letter abbreviation and the number. You see a lot of computer manufacturers who get this wrong with front panel labels that say "12MHz" or something similar.

e.g., 115V ac, 21.300 kHz, 10V

778. Q&A on Reorganizing rec.ham-radio

Newsgroup: rec.ham-radio
Date: 1990-08-30 16:57:38 UTC
From: paulf@jessica.Stanford.EDU
Message-ID: <1990Aug30.165738.4734@portia.Stanford.EDU>
Source record: 8882

Q: Okay, what's this all about?

A: Current authorship for rec.ham-radio is in excess of fifty articles per day, sometimes much higher. The ideal USENET newsgroup is somewhat less than half of that.

Q: What's causing the surge in traffic?

A: Probably two things. First of all, growth in USENET readership. Secondly, the increase in controversial topics, which reflects the growing controversy within the hobby.

Q: So, why not have lots of splinter groups?

A: Two reasons. First, most people's interests in ham radio are reasonably broad, across various activities. Secondly, doing so would be a major pain for those who manage gateways to mailing lists. It's unreasonable to ask them to add more than two subgroups at a time.

Q: Okay, but why does packet radio get its own group, but not (satellites | ARES | microwaves...)?

A: Arguably, packet is the fastest growing subcult in ham radio. Almost everyone has a TNC. And, this usage generates lots of questions, given that packet radio, when done right, is not a trivial thing. Do we really want hundreds of "how do I set up my TNC with xxx" questions in the main tech group?

Q: But I enjoy seeing all the flames...

A: Well, then there's a group just for you now. In keeping with the .d USENET standard for concussion, er, discussion groups, rec.radio.ham.d would provide an appropriate forum for discussing the various political topics that pop up regularly. Realize that most people really aren't interested in seeing long flaming discussions, and even those that like to get into the fray must refrain periodically to get some real work done.

Q: Why the tech / misc split?

A: Many people are interested in radio technology only, and not all of the nontech stuff (ARES, ARRL, etc). The tech / nontech split was the largest division I could come up with.

Q: So, when will this all happen?

A: Well, first of all, there needs to be a vote. I'll have to put together some automated votecounting software on one of the local vaxen.

I'll try to get to that in the coming weeks. Assuming (from my mail)
that the vote is positive, I'd create the groups, and give the
mailing list hackers a month or so to do their conversions, as well
as give everyone a chance to adapt to the new groups. Then the old
groups would go away.

>the end of it. I somehow must make an SO-239 available on the fender.

>How do you drill a hole without messing up the paint? Is there any
>danger of the paint chipping? (my car is 4 months old)

I used a Greeley (Spelling?) punch. You drill a small (1/4 inch) hole
and insert the screw thread of the punch through the hole. Spin on the
cutting die of the punch on the screw and tighten with a wrench until
the large hole is cut. (This asumes you can get at the other side.)

>What kind of SO-239 do I need?

I used a standard chassis mount type with 4 mounting holes. I used
sheet metal (self-tapping) screws to mount it to the car.

>What needs to be one to the edge of the hole to prevent rusting and
>galvanic reactions?

I made a rubber gasket to go under the SO-239 to keep water from leaking in.
(I think I used a piece of an old bicycle inner tube.)

>How do I ground the mount to the car?

I just depended on the connection thru the sheet metal screws.

>Thanks!

You're welcome!

Well...I started this monster (as far as the CA question is concerned)
and I think it wound up drilling antenna holes in my car!?? Anyway....
I placed a call to the DMV office in Mountain View, CA and was told:
$21.00 fee for getting the plates; you must fill out the Radio Call-
Sign application (this applies for both CB and Amateur I was told....
that's a laugh!); present to DMV - application, current registration,
current FCC License, current auto plates, and monies.

The kind person at DMV even offered to send the application to me!

She also said that if your registration is due within 60 days from
filing the application, that you must also pay your regular registration
dues!

Thanks to all for your kind responses....

In 1982, I successfully got (and still have) WB2GOH oh my car as a ham plate. The clerk said, shouldn't that be a six? I said, not any more, the FCC no longer requires you to change calls when you move. He filled out the form and the plates showed up one eternity later.

The cost was $20 to obtain the plate, and nothing special to keep it.

This afternoon I'm going to bravely go down to the DMV and turn in WB2GOH, reordering it as a motorcycle plate. I'll report back if it's anything other than $20 one time fee.

785. Re: Weird Shutdown of my Astron power supply while antenna tuning (RF?)

Newsgroup: rec.ham-radio
Date: 1990-08-30 21:33:32 UTC
From: dougb@hpnmdla.HP.COM
Message-ID: <1250220@hpnmdla.HP.COM>
Source record: 8891

I repaired an RS-20A once for a friend of mine who had the same problem you describe. He was using it with his ICOM 751A. As he raised the RF power on the ICOM, it would hit a treshold when the power would cut back and the voltage from the supply would drop.

The problem was one of the 2N3771 pass transistors (on the back heatsink). The socket that encapsulated the emitter and base leads did not make a very good connection and could not handle even a light load (like your 5 W situation). So, as a first look, check the connections to these transistors.

Also, since these transistors are, in essence, connected in parallel, you might try removing all but one (I believe there are 4 on the RS-35M?) and see if your voltage returns to 13.8 V (no load connected). You could replace one at a time to see whether one is not working.

Good luck -- hope this helps.

> political topics that pop up regularly.

I don't see the analogy with other Usenet groups. For example, rec.humor contains jokes, while rec.humor.d contains discussions about the jokes. But rec.ham-radio doesn't contain ham radio; it contains discussions about ham radio. How would we distinguish between normal discussions and those that should be moved to a side group?

>Q: So, when will this all happen?
>
>A: Well, first of all, there needs to be a vote.

Will this be a vote on all the suggested newsgroups at once? What if someone agrees with some proposed groups but not others? And what if the failure of one proposal affects the required charter of the other groups? Seems like it would be difficult to take votes on the whole slew at once.

Also, is this going to work for the folks on INFO-HAMS? Will they still be able to get everything they want? I haven't seen that question answered since it was first raised.

Neither. The metric system has been the legal basis of measurement in the US for over 100 years. It's just that the traditional system is also still legal. The traditional units have their legal definitions in the metric system.

We have met the enemy, and he is us.

At least the sorry history of the metric system in the US gives hope with respect to the OSI "transition". If government exhortations have failed to make us adopt the metric system, an international standard that really IS widely used in the rest of the world and is clearly superior to US practice, then they're even less likely to get us to toss out a proven set of computer networking protocols in favor of a so-called "international standard" that exists only on paper and is in many ways inferior to present practice...

796. Re: Internet link via RF

Newsgroup: rec.ham-radio
Date: 1990-08-31 05:28:31 UTC
From: mrapple@quack.sac.ca.us
Message-ID: <a5d528.396e@quack.sac.ca.us>
Source record: 8914

I have been refered to Ham Radio (RIP) magazine's December '89 issue,
where a 10 GHz system that fulfills almost all my requirements. Inquiries
are pending to the author(s) for PC board layout(s). Even if this
doesn't work, it'll still be a nice thing to have laying about,
as well as a matter of pride, etc. This leads to some further questions:

1. Of course EHF is dangerous, but is there any way to effectively
quantify the hazard? This thing aparently puts out about 10 mW of
power, which, with the dish, means about 10w of ERP with a 4 degree
half-power beamwidth. What kind of biological hazard is posed by
standing behind the dish, to the side of the dish, and in front
of the dish? How close to the dish in the directions I've mentioned
is considered safe? I want to be safe about this, but I'm unlikely to be
able to put this thing too far away from people. If that's not
safe, there's little point in proceeding.

2. The distance measured on a map turned out to be about an order of
magnitude higher than I first estimated (how embarassing!). The
link is about a half mile, rather than 100 meters. With line of sight,
this wouldn't matter, but without, is there any point in proceeding?
We do get fog. How likely is that to interrupt a link of this distance?

3. If anyone has this article, how easy would it be to move the
operating frequency of this device down? Sacrificing the bitrate
is OK, since the design bitrate is about two orders of magnitude
higher than my needs dictate. Along similar lines, what frequencies
in the low EHF range would be acceptable for this project? This
question explicitely includes non-ham bands where licensing procedures
would be either simple/cheap or non-existent.

4. If this doesn't work, I know a local repeater with a half-duplex
autopatch. I could let them use/have/borrow this thing for audio
and we'd have a full duplex patch. The article says this device
has a theoretical link distance of 40 miles. How well does that theory
stand up? How about with fog?

5. Anyone who is a 10 gig wizard, please send any advice you may
have for a ham whose highest QSO of any substance so far has been 220 Mhz.

I guess that's all for this time. I want to thank everyone who has sent
suggestions, and I'm sorry for getting a little cheesed about all the
packet suggestions -- I probably should have been more clear in my
original post.

797. Monitoring Air Force One Communications - End of an era

Newsgroup: rec.ham-radio
Date: 1990-08-31 06:29:04 UTC
From: die@cpoint.clearpoint.com
Message-ID: <7230@cpoint.clearpoint.com>
Source record: 8915
Cross-posted to: rec.radio.shortwave,rec.ham-radio,sci.electronics

The new Air Force One, a 747 with tail number 28000, has been
delivered to the Air Force and is currently conducting tests prior to being used
to carry the president for the first time.

It appears that this aircraft will use multichannel X-Band DSCS
(7-8 Ghz) or millimeter wave (20 and 40 Ghz) Milstar satcom for its
primary voice/data links to the ground, relegating the 225-400 MHz
UHF-FM-FDM Autovon GEP circuits and the 415 MHz NBFM "Nationwide"
circuit to the same low priority, infrequently used, backup role as the
traditional HF SSB "Mystic Star" channels that are still kept up
to AF-1 for communication coordination and emergency backup.

This means that in the next few days a 27 year long era will
draw to a close for radio hobbiests; it will no longer be possible to
listen in on much of the telephone traffic (almost all but the secure
satcom) from the presidents plane as it flies overhead. This marks the
passing one of the last "in-the-clear" federal communications systems
carrying genuinely interesting traffic that can be monitored with simple
equipment; although the UHF-wideband FM GEP Autovon and nbfm Nationwide
circuits will supposedly still be maintained to the plane and may carry
occasional traffic, it will likely be very low level, routine, and
infrequent.

For many years (from the 60s to the early 80's) the secure
circuits from the plane were often of such poor quality (1200 baud
vocoded voice was used for several years using first generation vocoders
designed in the 60s) that many presidential calls were routed over
the Autovon and Nationwide channels, and even in the last few years
quite a few presidential calls have showed up on these clear circuits,
especially on the Autovon (the "Alpha" and "Bravo") channels. For those
who enjoyed such things and knew about how the circuits worked there
was some interesting listening, especially in the early days of the
systems before the introduction of usable secure satcom for high level
calls.

So thus passeth into cryptographic obscurity one of the most
interesting remaining open federal circuits. Soon the only interesting
easily received US government signals in the clear will be NOAA weather
broadcasts, NASA Select TV and Wefax transmissions. I am sure that
there are those at NSA, IRAC and the White House Office of Telecomunications
Policy who are saying it's about time this was true.

I believe what you mean is Greenlee Punch. At least that's the name on
mine. I don't remember the size offhand and I haven't installed any
antennae lately, but they do make a punch that is just the right size
for putting in those Motorolla mounts.

At least once a month you provide an unprovoked attack against OSI. What's the
beef? Is this the code/nocode of the packet generation?

801. Frequencies For Egeland AFB, North Florida

Newsgroup: rec.ham-radio
Date: 1990-08-31 13:47:47 UTC
From: vail@tegra.COM
Message-ID: <1338@atlas.tegra.COM>
Source record: 8904

I am going to Florida the end of next week and will be bringing the IC-24 with me. Does anyone have frequencies that are used in that area that would be interesting to listen to? I figure I would scan the "normal" bands for aircraft and such. Assuming the 24 would recieve it ok. It does well for 120-130 aircraft band.

Thanks for the help.

>group as to where to find big ferrite rods.
I suppose you should be able to epoxy glue several AM rods end-to-end
together. Ferrite is (or used to be) some sort of magnetic material that was
ground up, mixed with an insulating glue, and molded into useful shapes.
Being ground up reduced eddy currents.

commercial map makers introduce little errors into their maps to trap other
mapmakers that might pirate copy the original. If the second mapmaker's map
has the same error, than it is obvious that he pirated the info.

Punching a hole from the "BAD" side to the "GOOD" side using a Greenly
punch without scratching the paint with the die (the cup shaped piece)
is no problem if you interpose a piece of cardboard between the die
and the finished surface. The small punch burr is no problem to clean
up if needed, just chamfer the hole with a knife. Using this technique
you need not find "wrench room" on the back side, only access space and
clearance to get the punch piece to the worm. I use the cardboard
usually found on the back of note pads and writing tablets, this is
sufficient protection for common chassis material, with the thin sheet
used in today's cars you can even use "oaktag", you know, the stuff
they make file folders of, heck, even a cereal box will supply the
required material.

Message-ID: <9008311704.AA09568@blackbird.afit.af.mil>
Source record: 8921

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Source record: 8926

If you ever get the chance to visit a LORAN C transmitter,
by all means do it. I saw one on the northwest coast of the island
of Hawaii last December. The finals ran about 15kV at 30A (450kW)
to a large (300meter high) loaded vertical. There was enough stray
RF in the transmitter room that the technician could make a nice
fireworks display by running a screwdriver over the gap between the
19" rack panels and the rack (yes, they were connected together, but
the 6" gap between screws was enough to make nice sparks). I could
hear the transmitter on the car radio for miles! Great stuff!

807. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-08-31 17:04:48 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9008311704.AA09586@blackbird.afit.af.mil>
Source record: 8924

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)

[Story about helping out the EMT after a backpacking accident and helping
people in the backcountry contact relatives deleted]

During the recent Yosemite fires, I overheard a conversation between a
ham on the top of Half-Dome Peak with a bunch of boy souts talking to
a ham here in the penninsula (Redwood City) via one of the local repeaters.
The guy in Yosemite knew about the fires, but after traveling all the way
from southern california, elected to enter the park anyhow (apparantly the
west side of the park never closed). Anyhow the ham in Redwood City set up
a phone patch lash up to the other guy's parents who were in Oakland.
Apparantly his parents were real pleased to hear from him and to find out
that they were safe away from the flames. It was pretty neat.

809. biological effects of handheld transceivers?

Newsgroup: rec.ham-radio
Date: 1990-08-31 19:01:25 UTC
From: root@vortex.COM
Message-ID: <49.UUL1.3#1@vortex.COM>
Source record: 8910

Does anyone out there have any reasonably up-to-date information on the current thinking regarding possibly negative biological effects from handheld transmitters (e.g. 2m and 440-450 Mhz units)? In particular, the effects on eyes (cataract and vitreous) and other biologic effects (e.g. brain effects).

At one point, the literature seemed to imply that eye effects were worse as the frequency went higher, and that brain effects (possible cancers, etc.) were centered around the 400-500 Mhz UHF region.

With the increasing use of handheld units with stubby little antennas and higher power (such as five watts, compared to older units that typically ran a max of one watt) these issues seem to be of increasing concern.

> 101Mhz.

I have the programming book from Bendix King for the VHF and UHF walkies and mobiles.

I believe that some of their radios can operate from 138 to 174 MHz, continuously. However, not all of their radios can use the entire range: some cut out just around 163 MHz, some won't go below 148 MHz, etc. Basically, you need the model number or just have to try it. I'm not aware of any hardware modifications which might expand the coverage, if any. If anyone knows of any, I'd be interested in hearing of them. Of course, I need to retain FCC type acceptance, so these probably aren't likely.

> What I need is a information on "secondary programming mode" and I
> need to know the meanings of options 1 - 12345 and 2 - 12345, as well
> as involk dtmf mode (Little Phone Reciver on display).

I'll bring in the information on Tuesday and send it to you (if you'd like to send me a good address), if you haven't found it by then. Although it is probably equipped with the keypad on the front, it does not necessarily have DTMF capability. King could learn something from the Amateur arena here. If it does have the hardware board, it can be enabled in the secondary programming mode.

Geez, if he wants to sell one of these, I'm in the market. Okay, since I'm posting this instead of mailing it, if anyone wants to sell one, please send me mail. Although I'm in an area which uses more than the 14 channels, I like the Kings. They're more easily field programmable than some, which is a bonus on some of our multi-agency calls. Yes, it requires something external to the radio, so it meets the applicable FCC requirements....

811. No-code HF license in Japan

Newsgroup: rec.ham-radio
Date: 1990-08-31 21:14:34 UTC
From: mbutts@mentor.com
Message-ID: <1990Aug31.211434.3678@mentor.com>
Source record: 8912

At the risk of starting another no-code flamefest which devolves into tedium...

At a dinner party for some visiting Japanese friends last night, I was delighted to discover that one of the visitors was a ham. Part of our eyeball QSO touched on comparing notes on the different license classes in our two countries. He said the most popular license in Japan is what he called "Novice Radiotelephone", which has no code requirement, but a significant theory exam: essay questions at the level of impedance, resonance, etc. The privileges are 80M, 40M, 10M and VHF SSB, 10 watts maximum power. I was very surprised to hear of this, because of the oft-cited IARU regulation requiring CW exams for HF licenses, but he insisted that this is the case. (He also mentioned that some of these hams run "Tokyo 10 watts", nudge, nudge, wink, wink, say no more...) I believe he said they also have a no-code license with a tougher theory exam and more VHF privileges.

In his experience (2nd class license for 15 years, DXCC on 40 SSB), the no-code licenses have brought in a lot of hams who upgrade to the higher classes as they get involved.

Of course, if you think about it, CW is not going to be real attractive if your language is not based on an alphabet. He said the higher classes which require code tests use the Roman alphabet with Int'l Morse, but that the top class also requires skill at the Katakana code. Katakana is a kind of larger alphabet with a symbol for each syllable. Katakana Morse has some pretty long characters, so Katakana QSOs use lots of abbreviations.

812. Crossed-Field Antenna Correspondence/Experimentation

Newsgroup: rec.ham-radio
Date: 1990-08-31 21:26:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9008312025.AA02669@ucsd.edu>
Source record: 8922

A few months back there was some discussion of Mr. Maurice Hately's (GM3HAT) Crossed-Field Antenna ("CFA") designs, as was originally described in the March 1989 `Wireless World' ("WW") Magazine. Since that time I haven't seen/heard anyone saying anymore about the antenna.

About a month ago I wrote a letter to Mr. Hately (in Scotland) and, received a nice reply from him last week.

In his response to me Mr. Hately enclosed a two page brochure, covering his CFA offering to the amateur community. In addition, he sent me a color (should I say "colour"?) photograph of an experimental medium-wave (I think 360 Meters wavelength) CFA that's being tested by Radio Cairo. Mr. Hately wrote (on the back of the photograph) that the CFA was providing a better received signal (no details given on what kind of test instrumentation) than a 75 foot vertical had given (admitedly, if my recollection of the 360 Meters wavelength is correct, then a 75 foot vertical is quite short).

I suspect that a lot of hams/engineers had the same first-reaction to the CFA that I did; "it's too good to be true". It was last year that we all got our hopes up when the `cold fusion' announcement was made, and there's been a lot of disillusionment over that. So, I think that there's a tendency to dismiss the CFA, partially as an attempt to prevent another hope from being dashed on the rocks of reality.

When I'd written Mr. Hately, I had mentally prepared myself to spend up to a few hundred dollars, to provide for the expenses of getting a CFA in-hand to test (OK, play with). I got a bit of a shock when my eyes made it to the `bottom-line' in the CFA brochure. Unless my math's really off-base, it'd cost a Stateside ham around $800 (U.S.) to purchase the amateur version of GM3HAT's antenna. I fear that price is a bit too steep for me to seriously consider directly buying a CFA from Mr. Hately at this time.

I'd like to find out if anybody else has looked into the CFA's operation, more specifically concerning the matching/phasing requirements of the `splitter' that feeds the `capacitor plates' (generating the E-field component), and the `top hat/ground plane' (generating the H-field component)?

It's my guess that a large portion (after excluding shipping costs, which are not trivial) of the price of the amateur CFA goes to the tuning-up of the antenna matching/phasing `box'. From Mr. Hately's brochure, it appears that the `match-box' consists of a SEALED (my

emphasis) box, with one coax input (going to/from the radio), two coax outputs (one to the `capacitor', and one to the `tophat/ground-plane') and, the front of the box is COVERED (my emphasis) with what appear to be toggle switches. I suspect that the CFA may take a fair amount of initial set-up time, to find the right matchbox settings, to provide the correct amplitudes/phases of signal driving the two portions of the CFA.

Does anybody `out-there' have any experience with CFA's?
Has anyone else looked into the CFA operation, and if so,
what conclusions have you come to?

If it were feasable, I'd like to build a CFA and write an article on it (perhaps for a publication like `QEX'?). I'm not aware of anything having been written-up on the CFA in the amateur literature. I haven't researched the professional publications (IEEE) but, I plan to go through my company's technical library, to see if there has been any further published information on the Crossed-Field Antenna theory/design (I doubt that I'd be able to follow the theory ... Mr. Hately obviously has a very comfortable relationship with Poynting Vectors and such ... I VERY DIMLY remember such things from an electromagnetics course years ago).

Feel free to respond directly to my InterNet address, or if you think that your comments might be interest to the rest of the INFO-HAMS group, go ahead and post your comments to UCSD (please copy me directly if you do so; sometimes I get `dumped' off INFO-HAMS by Brian's computer, and it takes me a few days to realize that things are too quiet!).

Thanks to one-and-all.

813. Re: Touch lamp RFI solution and tracking methods

Newsgroup: rec.ham-radio
Date: 1990-08-31 22:04:14 UTC
From: paulz@hpspdra.HP.COM
Message-ID: <12280013@hpspdra.HP.COM>
Source record: 8734

regarding the touch lamp RFI problem:
Try using an L filter instead of a PI. Connect a suitable cap across the triac and lamp, with the chock in series. Sometimes PI filters do not work as well as desired because the two caps have one lead in common. Unless the common point is really ground (which it is not, in this case) the two caps can actually bypass the chock!

814. "Long Distance" CPO (Code Practice Oscillator)

Newsgroup: rec.ham-radio
Date: 1990-08-31 22:28:27 UTC
From: paulz@hpspdra.HP.COM
Message-ID: <12280014@hpspdra.HP.COM>
Source record: 8732

First a brief statement of where I am coming from, then a request for advice:
There is indeed a big source of potential future hams. They are called Boy Scouts. Especially the younger ones who are not all wrapped up with football team, girls, and cars (not necesarily in that order). These are a group of boys who have a lot of ambition to try new things. I know, I have helped several (including 6 graders) pass their novice test.

Now, I am looking to construct a "long distance" code practice device, and welcome the net's constructive suggestions. One possibility to connect two keys and code practice oscillators with a couple hundred feet of telephone wire. Now, the boys can really communicate beyond a normal talking range.

Slightly more complex is to explore no-license transmitters. How far can they be expected to work? Lastly, what would be the simplest CW rig for a novice to cover a range of several miles? This last would allow the boys to QSO after school, and provide an incentive to the rest to get their tickets. Higher freq means smaller antenna so the radio could be taken on a campout. The object is to find an inexpensive construction project. HT's at $200 and up are not in the right budget class.

Nick,
Since I have already answered many of your questions directly I won't
repeat myself on this wide forum but I just *have to (:>) clarify
one point....

you say:
> 1. Of course EHF is dangerous, but is there any way to effectively
> quantify the hazard? This thing aparently puts out about 10 mW of
> power, which, with the dish, means about 10w of ERP with a 4 degree
> half-power beamwidth. What kind of biological hazard is posed by
> standing behind the dish, to the side of the dish, and in front
> of the dish? How close to the dish in the directions I've mentioned
> is considered safe? I want to be safe about this, but I'm unlikely to be
> able to put this thing too far away from people. If that's not
> safe, there's little point in proceeding.

This is a very common thread of thought, but also very misguided.
In actuality the 10 mW coming out of the dish is at least
1000 times
>>>> less dangerous <<<<<
than the horn or (worse yet) the waveguide flange by itself.

The highest fields, those most capable of causing a problem are
present when all the power is present in a small aperture. This is
the case with dipoles and low gain antennas (like a waveguide flange
or horn feed of a deep dish). When the energy is used to illuminate
a large parabolic reflector, it is spread out immensely. The ERP
only tells you what the FAR FIELD is like.. it produces the same
field that it would take a much larger transmitter to produce were
there no antenna gain. It does this because the signal emanating from
every portion of the high gain antenna's aperture adds coherently and
maximally in the direction of the beam. The *actual* power/unit area is
never much bigger than that coming out of a dipole driven by the 10 mW
source. Shortened dipoles or monopoles represent the smallest realizable
antenna and have only a slightly smaller aperture than does a full size
dipole. A dipole has about a 1/8th lambda square aperture so you can compute
the potential for injury using your favorite guidelines... 0 dBm/cm^2
or whatever you like.
The biggest danger anyone is likely to see from these modules is
probably at the entrance to your local supermarket since the door openers
use a lower gain antenna. Still I suspect that by far the biggest potential
for injury is from hitting your head on the door jamb....

I'll take standing (floating?) out in front of the Araceibo (sp?) 1000 foot
dish with the biggest transmitter you can muster any day over peering in the

crack in the door of a leaky microwave oven.

818. Need Help With VAX VMS DeCompress of INFO-HAMS Archives

Newsgroup: rec.ham-radio
Date: 1990-09-01 01:24:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9009010024.AA14928@ucsd.edu>
Source record: 8727

I need some assistance in figuring out why my efforts to decompress some `INFO-HAMS' archives (from UCSD.EDU) are not going well.

I'm `on' a VAX cluster (running VMS), and I've gotten a copy of the "lzcmp.exe" and "lzcomp.exe" files (several folks, here on INFO-HAMS, responded to my "where's a VAX VMS functional version of the UNIX `compress' program, that I posted a few weeks ago). I can compress and then decompress my files but, when I get an archived INFO-HAMS file from the UCSD.EDU archives, something goes wrong.

On two different attempts, "lzcmp.exe" gives me an error message; something to the effect that it couldn't finish decompressing the file. When I go look at the decompressed file (it DOES produce something ... that's progress over my previous efforts!), it appears as though the last portion just isn't there. A sentance will stop in the middle of a word, and the next line is the end-of-file. Theres no `garbage' ... the file simply quits before it should.

I have a `compress' program on my Amiga Computer at home, and there were some `help' files to guide me in using it. Not having any UNIX experience, but figuring that the VAX's `compress' routines would have similar options as my Amiga's (since they're both modeled on the UNIX `compress' program), I tried a "-h" suffix to the decompress command (suitably defined in my VAX "login.com" file), and sure enough, there is some rudimentary `help' information available that way ... apparently not enough though (!).

It's kind of embarassing ... here I have a nice mainframe at my disposal, and I can't decompress some simple text files. Last night I got a compressed InterNet document (the "RFC" type `stuff'), down-loaded it to my Amiga at home (`KERMIT' is slow!), decompressed the file, and `dumped' it back to the VAX (again suffering with KERMIT!).

Advise would be appreciated.

Thanks,

Paul Nix InterNet: nix%muppet.decnet@consrt.rok.com

PS - Before any VMS experts tell me about "XMODEM", as being faster than KERMIT ... I know only too well. Two or three of us have tried to get XMODEM to work, but something in the VAX-LAN-modem interface (that I have to go through when dialing in from home) `kills' XMODEM after the first blocks try to get through. KERMIT, although painfully slow, does work.

> > We had a 15-minute ham radio program each Sunday; talk about TRYING to go
> > broke...The

Back in the late sixties there was an outbreak of 3 Meter QSOs in the Copenhagen Denmark area. At that time in most of European radio was still a gummint monopoly. Part of the wisdom of the gummint said that the FM band could only contain 3 or 4 local stations without adjacent channel and co channel interference. Like once a year for 3 hours when the sporadic E was so good you could hear Italy and France on the VHF FM Broadcast band. Well, you could hear this stuff because the bands were so under used.

Some local ham types, mostly unlicenced, were tired of tuning their B&O FM radios up and down a band that only offered "Program One, Two and Three". Really imaginative folks down at Radio Denmark. All that empty spectrum. They had the receivers, they had the antennas. All they needed was the transmitters. Thus the "Tre Meter Band" was born. Using PA mic amps and simple tube transmitters deviating +- 75 kHz real hi-fi QSOs were held around the Copenhagen area. Some of these signals were excellent with the pirates priding themselves in their hi-fi signals using Sennheiser mics etc. For some reason this was all chat, no one thought of connecting a turntable - that I heard - and spinning a Victor Borge or two.

After a few months it came to an end. The local Post and Telegraph paid a visit and all the fun went out of it.

A couple of the leading lights of the "Three Meter Band" became excellent RF designers and put out some nice Two Meter kits as well as getting real jobs with one of the local two-way manufacturers.

|> This used to be true John. The networks quit doing this some time
|> ago.

It depends on where you are. When I worked at the Maryland Center for Public Broadcasting about 15 years ago, a cesium frequency reference was installed in order to conduct some navigation experiments (the Maryland Center runs a series of slaved UHF transmitters around the state that covers, among other things, Chesapeake Bay). Before that they had a rubidium standard. I don't know whether they still have it.

You can always try calling the engineering departments of your local TV stations and asking what kind of master subcarrier generator they use.

Standard broadcasting practice uses a master 3.58 Mhz subcarrier generator (usually with backup) to drive dividers that generate sync signals that are distributed throughout the station. This means you need not look at the color subcarrier to get your frequency reference; the horizontal and vertical sync signals are equally stable, and these are usually easier to extract from your TV set (especially if it is a black and white model).

Phil

By the way, with really stable (cesium or rubidium) frequency standards you can readily detect the motion of a (nominally) geostationary satellite as it carries a TV feed. I once tried this at the Maryland Center as they uplinked Wall Street Week. I watched the downlink signal on a vectorscope that had been synchronized to local (uplink) subcarrier. The relative phase of the downlink subcarrier slowly rotated as the satellite moved toward (or away, I don't remember) from the ground station. One complete rotation would correspond to a change in path length of only 40 meters (1/2 the wavelength of the color subcarrier).

Source record: 8735

trivia:

The NTSC color subcarrier (3.579545454545....) is defined in the FCC rules for broadcasting as: (5 MHz)*63/88. The vertical field rate can be derived from that with: SC*4/455/525 and you get 59.9400599400599400....

Black and white broadcasts are supposed to have the color subcarrier turned off, but I've seen many that do not. I suspect that even if they turn it off, the horizontal and vertical rates will still be synced to the source deriving from the color subcarrier anyway (and hence vertical will not be exactly 60 Hz).

>>Sign application...

>Two friends of mine said that I cost them $54.00 to get ham plates in CA.
>Does anyone who recently got one know about the fee?

I posted a note a little while back that I thought it cost $21. Well,
a few days ago, I got my cancelled check back, and it was... $21.00.
(Confirming that I may be getting old, but memory loss is not a
complete problem yet :-) This was a little over 4 weeks ago (nope,
no plates yet). Since Troy was given the same number by the DMV, we
can assume that there is something very wrong with the $54 number.

Now, because of my call, I wonder if most people will confuse the call
plate with a vanity plate (the plates will be on aa Saab aautomobile).
Fortunately, I do *not* look sixty (at least I don't think so :-).

I recently got hold of a copy of the Heathkit 1990 Summer catalog. In the Amateur Radio section of the catalog, where it advertised its small packet transceiver, there was an article in the margins which made reference to the November 1990 Space Shuttle mission which was going to be sporting the Packet.

My question is if anyone knows the dates, exact times (UTC or EST), and 2 meter frequencies which the shuttle crew will be using for this project (and any other information you may have).

I am not yet licensed (but am taking my Novice exam within the next two weeks!!!), but I do have a friend of mine who has his General license.

Any information regarding this shuttle mission would be greatly appreciated.

Thank you very much.

You can still do this even with the relatively unstable crystal
references now used since you are both the uplink and the downlink
station any drift in the reference cancels. If you want to see a
real drifter, look at Spacenet 1.

It may have been changed, but the last I heard, the only time an AFB uses the 120 - 130 aircraft band is when talking to civilian aircraft such as CAP, private airplanes owned by base personnel, etc. Normal AF air - to - ground is above 225 mhz.

In the bookstore yesterday, I saw an article that might be of interest to you.

It was in one of those electronics magazines (Radio Electronics?) and
was about "through the earth" communications.
Essentially, you drive two conductive stakes into the ground, and using
"around the house (who's house ?)" electronics, you communicate between
them.

Range was several hundred yards. Sounds like a great Scout project!
The plans were for DX, but CW might give you better range and be easier to
construct.

The ARRL Letter - Volume 9, No. 16 - August 10, 1990 -

FCC Issues Notice on Testing of Disabled

The Federal Communications Commission on August 1 issued a Notice of Proposed Rule Making on Morse code testing of persons with disabilities. At an open meeting, the commissioners announced NPRM 90-356, proposing amended rules "to accommodate those persons who, because of severe handicaps, have extraordinary difficulty in passing the higher speed Morse code telegraphy examinations for amateur operator licenses."

While the subject had been broached earlier (see *The ARRL Letter*, June 29 and July 13, 1990), specific written information was not made available until after the ARRL Board of Directors had held their second 1990 meeting late last month.

For some time, volunteer examiners have exercised discretion in accommodating persons with disabilities, giving them several options in the testing of Morse proficiency. FCC Rules Part 97.509 (h) say "The administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. The administering VEs may require a physician's certification indicating the nature of the disability before determining which, if any, special procedures must be used."

On July 18, in a letter to volunteer examiner coordinators, FCC went a step further, asking VECs to "please expand the special procedures the VEs make to accommodate handicapped individuals."

In that same letter, FCC said "The Commission's policy is to exempt from the 13 and 20 wpm examinations persons holding a current, or within the renewal grace period, Novice, Technician, General, or Advanced Class operator license who, because of their severe handicaps, cannot pass these examinations even when the above special accommodation procedures are used."

At the same time, in what the Commission referred to as "interim procedures," volunteer examiners were given specific instructions for obtaining a physician's certificate (to the examinee's disability) as well as guidelines for applying to FCC for a total waiver of the 13 and 20 WPM Morse examinations for those individuals.

FCC said at that time that a Notice of Proposed Rule Making was being drafted.

In its June 15 statement, FCC codified procedures for accommodating disabled applicants, saying that special testing--such as substituting a sending for a receiving test, or pausing the CW tape to allow the examinee to speak or otherwise communicate the message to the examiner--now could *only* be done given a physician's certificate of disability.

The aim in accommodating disabilities is to encourage the applicant to make a "good faith effort" to pass the exam. In a recent letter to its volunteer examiner teams, the ARRL said "In most cases, the (flexibility specified by FCC) will allow the candidate to pass the Morse code examination on his/her own--therefore not requiring a waiver of the Morse code requirement because these procedures may have accommodated the severe handicap or disability."

In its letter to license applicants, ARRL says "We would hope that you have at least attempted to pass the examination using the new, more flexible examination procedures announced by the FCC June 15, 1990.

The Morse requirement in its most basic form has not been eliminated--waivers are available only to applicants already holding at least a Novice Class license. This meets international requirements (for operation below 30 MHz) that the licensee have demonstrated a knowledge of Morse.

ARRL also has provided volunteer examining teams with instructions to physicians, along with the proper form for the physician's letter to follow. Since physicians generally are not Morse proficient and may have little idea of the skills and abilities needed to become so, the League's instructions to them contain a brief tutorial on both Morse code and on how Morse examinations normally are administered.

The instructions to physicians also point out the new procedures for accommodating people with disabilities, noting that (The VEC is) "looking to you as the expert to detail why the patient may not be able to participate in the examination process" (despite the various accommodations available).

The FCC's NPRM 90-356 closes with this:

"...the proposed rule changes would be more efficient and effective than reviewing waiver requests from severely handicapped individuals on a case-by-case basis."

The Commission asks for comments "on all aspects of this proposal."

It is anticipated that volunteer examiners in particular will have something to say, both about the proposal itself and about the way in which the new procedures were announced, then spelled out, and finally followed by an NPRM initiated by the Commission itself.

As the League noted in its latest message to VE teams, now that an NPRM has been issued, the time has arrived for examiners "to express their philosophical and procedural concerns." For some initial reactions to the FCC's proposal, see "Happenings" in September *QST*.

In its June 15 statement, the FCC noted that the number of requests from disabled persons for Morse waivers had increased (although they did not say

if these were requests to waive 5, 13, or 20 WPM). The FCC (namely John B. Johnston, chief of FCC's Personal Radio Branch) also mentioned that "three persons...have filed discrimination complaints under the Disability and Rehabilitation (Act).

BLIND HAM HONORED AT WHITE HOUSE

A 21-year-old Extra Class ham who has been totally blind since age 9 has received the Recordings for the Blind 1990 Scholastic Achievement Award. Scott Charles LaBarre, KT0U, of Woodbury, Minnesota, a recent graduate of St. John's University, in Collegeville, Minnesota, received a check for $3,000 from the General Electric Company for "extraordinary scholarship, intellect, enterprise, and service to others."

LaBarre, who plans to enter law school this fall, earned his Novice license at age 13 and his Extra by 14, through the Golden Valley, Minnesota-based Handi-Ham System. For more information on Handi-Hams, who have helped thousands of disabled people to become licensed, write to Courage Handi-Ham System, 3915 Golden Valley Road, Golden Valley MN 55422 (612-520-0511).

FORMER HAM CONVICTED

Richard A. Burton, formerly WB6JAC, was convicted in federal court July 20 of illegally operating a radio transmitter. Burton, arrested May 17 following an investigation by Los Angeles area FCC engineers acting on complaints from amateurs, had been charged with three felony counts of violating sections 301 and 501 of the US Code.

In the early 1980s Burton's license was revoked for Part 97 violations. After his appeals were turned down he was ordered off the air, but he continued to operate using his rescinded WB6JAC call sign. On January 15, 1984, US District Court Judge Manuel Real sentenced Burton on four misdemeanor counts of operating a transmitter without a license. Following appeals, Burton served seven months in jail and five years on probation.

Burton now faces possible fines of up to $100,000 and/or up to two years in federal detention. Sentencing is scheduled for October.

NASA TO TEST SHUTTLE AGAIN

A "tanking test" of the Space Shuttle Columbia is scheduled for around August 17, with rescheduling of flight STS-35 for around September 1, if all goes well. Ron Parise, WA4SIR, will be the SAREX astronaut on STS-35.

Astronaut Ken Cameron, KB5AWP, will speak at the ARRL Southwest Division Convention in San Diego on August 25, while Parise--who it is assumed will be in quarantine before his flight--will talk to the convention banquet by telephone.

STS-37 astronauts, scheduled to fly in November, now have received their licenses; in addition to Cameron and Jay Apt, N5QWL, new licensees include Steven R. Nagel, N5RAW, and Linda Godwin, N5RAX.

DXCC AUTOMATION UPDATE

A little known benefit of DXCC automation currently underway is that QSL cards will need be submitted only once for the multitude of awards now available from DXCC. Once a card has been processed and logged with call sign, date, band and mode, that credit will be available in future years for an applicant's band and mode endorsements.

That's the good news. The flip side is that the DXCC backlog is expected to worsen somewhat over the next year or more, as the process of "backfilling" continues. Several HQ staffers are working overtime (up to 40 hours a week) on the initial phases of automating the DXCC Branch, which now is processing submissions made in March. Mail received after June 1, which will be processed in September, will be the first to be done entirely by computer. At that time, the process of backfilling will accelerate, adding temporarily to the backlog.

OH! WHAT AN EXPEDITION

An all-Finnish team will invade the Caribbean island of Curacao in the Netherlands Antilles for the 1990 CQ Worldwide DX Contest. 55 operators and 40 support personnel will occupy both the Coral Cliff Hotel (a longtime Amateur Radio haven) as well as clear out acres of brush adjacent to the hotel in order to set up additional stations in construction trailers.

Radio Team Finland will sign PJ9W on SSB for the 'phone contest the last weekend of October, and PJ9A on CW at the end of November. Towers and antennas are currently being assembled and tested in Finland by OH6RM before shipment to the island. They will include a wire beam on 160 meters, a 3-element Yagi on 80 and stacked Yagi arrays on 40-10 meters. Rigs will be 15 Yaesu FT-1000s, with amplifiers.

BRIEFS

* Plumb Crazy is off the air. On July 6, according to the Oakland (California) Tribune, FCC personnel and US marshals, armed with a civil order, nabbed five modified CB radios and two linear amplifiers from Plumb Crazy's (whose real name is Harvey Peters Jr.) home. FCC representative Amy Freundlich said, according to the Tribune, that "the federal raiding party carted the equipment out of Peters's home to the congratulations of neighbors."

Peters faces $1,200 in unpaid fines, according to the Tribune.

* In the continuing effort to attract young people to technical pursuits, Carole Perry, WB2MGP, recently addressed members of the Society of Women Engineers at their meeting in New York. Perry told the group's education forum of the League's work to encourage youngsters to take up Amateur Radio, and suggested possibilities for cooperation between the League and the Society. Getting more young people into technology and science "is a national problem and one that requires a concerted effort between commercial interests and educational institutions of all kinds," she said.

"As I made the case (for Amateur Radio)," Perry said, "I was gratified to see how well received the information was with the group in attendance."

WB2MGP was the 1987 ARRL Professional Teacher of the Year as well as the Dayton HamVentionr Ham of the Year in 1987.

* Spurred by at least one book on the market telling the nontechnically adroit how to modify their radios, Kenwood USA Corporation has issued a press release on the subject. "MARS and Civil Air Patrol operators can obtain (Kenwood) radio modification information...at no cost. We require a copy of your MARS or CAP permit for this information.

"Please note that although modification information is available elsewhere, its validity and accuracy is questionable. Use of such incorrect information will void the warranty and possibly damage the radio.

"Kenwood policy is and always has been to protect the frequency spectrum for legitimate MARS and CAP operators. Protect your radio, and our frequency spectrum--use official Kenwood documentation."

* On July 27, the ARRL filed its legal brief with the US Court of Appeals for the District of Columbia Circuit in the matter of the proposed reallocation of the 220-222 MHz band to the private land mobile service. The brief reiterates the League's position, which already has appeared in QST. Oral arguments in the case of ARRL vs FCC and the United States of America are scheduled for November 16, 1990.

* ARRL Northwest Division Director William Shrader, W7QMU, has been named to the ARRL Planning Committee. The committee's makeup, originally ARRL officers only, was recently broadened to allow inclusion of directors and vice directors. Vice President Rodney Stafford, KB6ZV, chairs the committee, whose mission is to draft a recommended long-range plan for the League.

* While it is not allowable to request a specific call sign, any amateur may swap his current call for another one. This little-used option is available by filing with FCC a Form 610 and requesting a change in call sign (Item 2E). In return, the applicant will be issued a call appropriate for his license class, from the standard rotation of new calls.

* The League once again has asked FCC to take action on international intruders in our HF bands; cited this time were two Soviet stations on 20 meters, as well as five intruders on 17 meters, coming from China, Argentina, the Soviet Union, and Sudan.

* Kelly Howard, N6PNY, one of the teenage stars of the 1987 ARRL film New World of Amateur Radio, was married on July 28, to Steven Lenhert. (Thanks to Westlink Report editor Bill Pasternak).

SB RTTYDX @ ALLBBS $RTDX0831
RTTY DX Notes 1of3 8/31/90

RTTY DX Notes for week ending 31st August 1990
BID: $RTDX0831
Part 1 of 3.

We were speaking about QSL cards the other week, so I looked at some
of my needed ones. I see that we are still waiting for cards from
September 1989 and November 1989, and for cards through March and
April 1990. So it seems that some people are more diligent than
others. Bye the way, cards for VK9LI have been sent to all those
received. But then he did not have 14,000 QSOs.

Our thanks this week go to I5FLN, I5ICI, I5IGQ, OD5NG, TG9VT, W2JGR,
and the Tri-State DX Association VHF packet cluster. Thank you all
for your assistance. Without your help these notes would not get
written.

RTTY DX Notes 3of3 8/31/90

RTTY DX Notes for week ending 31st August 1990
BID: $RTDX0833
Part 3 of 3.

JH1NBD is still heading for the Seychelles (S79) for a stint from September 13th to 17th.

DF2UU was anticipated from Iceland (TF) in August. So far no reports of his activity.

JA2NQG will use KC6CW and JH1BNL will use KC6DX from September 13th to 16th. They will then go to Yap and use V63AN and V63AR respectively from September 16th to 19th. QSL to their holme calls.

JH1QDB will sign /JD1 (Ogasawara) from September 23rd to 30th. QSL to his home call.

The Malpello operation has been advanced to November 2nd. Financial assitance may still be sent to HK3BED, Arturo Afanador, POB 91135, Bogota, Colombia.

South Sandwich and South Georgia Islands are still anticipated around November 26th. Further information may be obtained from AA6BB/U, Jerry Brandon, 93787 Dorsey Lane, Junction City, OR 97448. He will also accept financial assistance for the operation.

Sorry to say, people, there are some errors in the script this week, due to machine failures. We have done the best we can, but the rotten machines won't speak the same language that I do. I will apply the hammer and hope for better things next week.

GL DE DX1.

There is also the concept (if I might bring it up) of "homebrewing" at a higher level: developing software

The problem with this is the lack of availability of the parts. What we have now are whole computer systems (e.g. PC clones and others). While PC clones can be had for cheap as computers go, they cannot get as small and cheap as the MINIMUM hardware necessary to implement some smaller project.

Kantronics is attempting to (at least partially, e.g. for TNC functionality only) address this. I still don't have the technical data to know just to what extent this system is really open. I also hear that AEA is offering a DSP based modem. I can think of some NON-modem things I'd like to do with a DSP processor, though I suppose one could come up with a line of reasoning that argued that it was modem anyway.

The reason I am a skeptic is that I frequently get confused looks from people when I tell them I am interested in buying their piece of equipment WITHOUT the software, and empty PROM sockets, in exchange for copies of the documentation of the level needed to develop software on. One example is Spectrum, the company that makes repeaters. They offered to have THEIR programmer custom develop software to my specs at a rate that would come to about $1000. Well if I knew for certain of EXACTLY what I wanted the repeater to do, and if I believed they could develop it BUG FREE, that would be a fine price. In reality I am not sure how I would want it to behave, and getting it BUG FREE the first time is not exactly typical. If I were to program it myself, I'd be looking at burning code onto PROMS at least a couple times every month and maybe a few times in a flurry.

The guy from Spectrum also wondered why I could not just program it like everyone else does to do what I want. First of all, these things are CONFIGURED, not programmed. It had lots of features, but it also missed a lot that I wanted, particularly with configurable parameters that would dynamically change according to particular conditions based on some specified algorithm. For example, I might want the tail to be longer in the first transmission after having been idle for 2 minutes. The configuration choice I had was in simply setting the length of the tail, period.

I can understand that a company might be concern over the proprietary details of the design of their machine. If I knew how to program their repeater controller, I could potentially engineer one myself that is "as easy to program as theirs" and market it in competition. But if that was really their primary concern, they could have just said so. Instead they responded in ways in which they failed to recognize any interest in doing this form of "high level" homebrewing.

Well, maybe the Kantronics and/or AEA boxes are flexible enough to be programmed to be repeater controllers :-)

841. CES Simplex Patch - info wanted

Newsgroup: rec.ham-radio
Date: 1990-09-03 06:54:23 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <29087@netnews.upenn.edu>
Source record: 8752

I just got a CES simplex/repeater autopatch and am trying to find out the format for the CWID PROM. Attempts to contact CES by phone have been unsuccessful (no answer). Does anyone have any info on the type of PROM and the format for the data for the CWID? Right now it has no PROM at all installed. I'd like to burn my own, as the patch is owned by two of us, and will be installed at a club station temporarily, so I'm going to need 3 different calls programmed, which is why I want to do it myself instead of paying the factory for 3 chips. I have the manual for the patch, but no schematics, so I don't even know what type of IC it is. Any info would be appreciated.

842. Weather FAX

Newsgroup: rec.ham-radio
Date: 1990-09-03 09:29:30 UTC
From: paul@wa1omm.UUCP
Message-ID: <paul.4550@wa1omm.UUCP>
Source record: 8753

I was caught off-guard today while recording some weather satellite photos from 10.863 MHz USB. At 1400Z, a GOES Full Disk weather photo is usually transmitted at 120 LPM. However, instead, several MET4 low altitude weather photos were transmitted at 240 LPM! The header I managed to read off one of the images was as follows:

MET4 03 SEP 1990 1400 VISI+2 C3D

I assume that the C3D is a location. Does anyone know for sure? I could not pinpoint the geographic location by the view received. I also assume that VISI+2 is an indicator that the image was a visible spectrum image.

Actually, Spectrum may not be releasing details of their box for less
sinister reasons than fearing the KA9GWM TurboController might be
advertised in QST next month. Companies don't release the level of doc
you are after for several reasons:

1. Misplaced paranoia that their widget will be cloned by a
competitor. Probably not the case with a repeater controller.

2. Not having a documentation kit for lower level details.
Internal docs used for programming a box are not necessarily
something appropriate for use by customers. Low demand for
such documents probably keep the company from investing
resources in producing user level docs of internals.

3. Not wanting to support your efforts at that level. Telephone
support is expensive and ties up resources.

4. Liability - it is conceivable that someone could injure
themselves while futzing with the box. Probably not the
case with a repeater controller, but I doubt GM will support
your efforts in hacking their engine control uP.

5. They may not want to promulgate hardware details out of
concerns that a particular instance of hardware might become
a de-facto standard people come to expect. Such a standard
might inhibit their efforts to change their technology to eg
lower costs or increase profit margins.

Personally, I don't see any reason to pine over this at all. In these
days of cheap single board computers aimed at the instrumentation/embedded
control markets, only the true "appliance ops" are using repeater
controllers ;-)

In every case that I've pursued so far, the reason a manufacturer didn't release the low-level details of programming controllers is that he didn't KNOW them.

Typically (especially in the ham marketplace), these sorts of things are bought on a contract basis from an independent supplier, who turns over the prototype hardware and software, then works with the manufacturer until the product reaches the market. From then on, the manufacturer has the whole enchilada, with enough documents to make and sell the thing. It's unlikely his employees are intimately familiar with either the hardware OR the software.

Assuming the manufacturer in fact has people capable of working on the software, it's likely that they haven't done so yet on a new product, and probably won't until complaints and bug reports come in. Remember that a maintenance programmer often doesn't have the big picture AND the fine detail unless he's worked on the system long enough to have learned them - it's not his job, which is to fix bugs. Bugfixing doesn't often require that you know everything about the system.

Couple that with the fact that very very few of the purchasers of what is really a low-demand item in the first place will be people who want to and are capable of making low-level changes in the operation of the widget, and it's just not worth it to the manufacturer to try to document the operation of the widget at that level of detail.

I do think that manufacturers should be willing to release source code for their devices, perhaps under non-disclosure contracts, but none are that I know of.

And that's why I build my own controllers.
- Brian

This explains some of the p***-poor support I have gotten from certain
companies on other products (e.g. PC clone "makers" maybe?).

> Assuming the manufacturer in fact has people capable of working on the

What a boring job, fixing someone ELSE's bad programming.

I can see this, and suspected it all along, but the ignorance level of
the people involved makes me think their line of reasoning didn't even
make it to this level. Perhaps the problem is that the guy who I was
talking to was "pure salesman", a species that should be banned at hamfests.

> I do think that manufacturers should be willing to release source code

>biologic effects (e.g. brain effects).

I haven't read anything official, but I know that when I transmit
on my 4-watt 440 hand-held into the rubber duckie, I will get a
headache within about 5 minutes of intermittent operation. That is
why I usually use low power, which doesn't give me headaches. The
same thing happens to my friend with a comparable radio.

What do you mean? One of the things that drove me towards software development (besides its inherent fascination) was constant frustration in getting parts for hardware development. I don't know of any other field in homebrewing where you can easily get so many parts over the phone. I don't mean just ordering them over the phone, I mean actually *obtaining* them through the phone line. :-)

The other great thing about software is that it is so easily replicated. Building the first prototype of a hardware project is fun, but duplicating it can get old pretty quickly. Fortunately I have here a magic machine that can automatically duplicate any homebrew software project in a matter of seconds or minutes, as long as you keep feeding it electricity and raw materials. And the duplicates are just as good as the prototype...

Phil

Message-ID: <30500716@ux1.cso.uiuc.edu>
Source record: 8762

There is also another issue with respect to "homebrewing".

Some people will take a project published in an article of book and built it exactly as published.

Some people will take the above project and change it, either to deal with some difference in their tastes, to make it easier (delete the tough feature they don't want), or to adapt it to a different need or project.

Some people will actually design something new.

Again, the level is important here as well. One does NOT have to construct their own inductors to do homebrewing, whereas someone else might, and in some cases you might actually have to. Try building a 1.5kw 160 meter linear.

If you take store bought gear and connect it together in some new way that has never been done before, then that is creative. If it also works, then that is wonderful. It isn't any less important. Each person needs to pursue what interests them. And each person needs to be recognizant of the interest of other people as well.

(rest deleted)

This is a good idea. But, while the max power for transmitting without a license is 100 mw, you still have to be careful and not interfere with existing licensed activity. I doubt that this will be a problem, though, because you gain nothing by transmitting on a "used" frequency anyway since the licensed transmitter will drown out a 100 mw rig.

It used tobe that you could buy transmitters and kits that worked on the BC band. Are they still around?

>How cheap and where do I get one (ONE!)?

Do your own homework, phil. Check any issue of "Circuit Celler", "Embedded Systems", "Measurement & Controls" (an ISA publication), "Electronic Engineering Times" or any other trade magazine for literally dozens of ads. The world is swamped with SBSs. HINT: The Micromint will sell you SBCs containing 6809, 8041, 8051, HC64180 or Z8 processors. The 8051 and Z8 processors are available with built-in BASIC so you don't even have to dirty your hands with assembly language.

But when you get right down to it, I don't really know why you'd want to buy just one. In about the time it would take you to order one of these boards, you can whip your own together. IN the 80[48,51] and 680X class processors, all one needs is a processor, a crystal and some line buffers (optional, depending on what you are doing.) Of course, you WILL have to buy a device programmer. Public domain cross assemblers are available for the PC and for less than a hundred bux, you can get a full simulator for any of the above chips.

John

CA used to issue call plates only to area 6 calls. But now DMV has no area restrictions. I would think that most states would be the same in that the states are aligning themselves with respect to uniformity/recipriosity of driver's licenses.

Has anyone experience with the ICOM IC-735? I am new lis and want to
buy a shortwave transceiver. Other alternatives would be the FT-757, or
the TS-440.

The software is not the problem. If all I wanted the hardware for was for
just my own use, these sources of circuits would not be a problem either
(except for my current space limitations, but this can be worked around
on a small scale).

What I want to be able to do is to write the SOFTWARE and either sell it
or give it away, and let people put it on their own box. I do not want to
be in the business of hardware. If I write an application for the PC, I
do not have to sell them a PC as well.

This is why the idea of the Kantronics Data Engine interests me. It *MIGHT*
be a standard and available platform for software independently provided.
The AEA DSP box might have similar usability.

For hardware to qualify, it must:
1. Have no software bundled with it, or if there is, it is of only a
minor contribution to the cost, and generally useful.
2. Marketed on a wide scale relative to the scope of usage intended.
3. Be completely self contained to the maximum extent the purpose requires.
This would generally mean a power supply, or standard power inputs.
4. Have a changeable software medium (socketed EPROMS are fine) or at least
downloadable from a personal computer.
5. Require minimum hardware work by the owner to get it up and running, e.g.
install ROMS, hookup to whatever, plug in power, switch on.

> have to dirty your hands with assembly language.

These publications have stuff generally intended for hardware hackers.
That's fine for hardware hackers who want to use my software. But what
about the appliance operators, or more specifically, the high level
network builders?

I've never heard of Micromint. Per chance might they have a 56001 SBC? You might also mention where these publications can be had, subscription prices, etc. I've only heard of "Circuit Cellar" and last I saw, it was a column in some magazine (was it Byte?). Remember, I'm a SOFTWARE person, NOT a hardware person. I don't get, or know about where to find, such things as EE trade rags and such. But I'm sure I can understand most of the tech talk in them.

As to getting my hands dirty with assembly language, it's MUCH better than getting them bloody with BASIC. If I want a high level language, I'll use C. Unless these SBCs typically run at 33 MHz or so, I'll have to go back to assembly to get the speed I want. I do a LOT of programming in assembly language now and am very comfortable with it on several machines, so why should even consider BASIC? I hope I can get a refund for sending back the ROM chips with the BASIC interpreter on them.

How about light-wave communications? Photodetectors and flashlights for example. A photodetector at the focus of a parabolic reflector can be pretty selective (Radio Shack sells both the detectors and the parabolic reflector, though they think the reflector is a solar cigarette lighter.) or you can use lenses for less distorted reception. For better signal-to-noise, you can modulate the light either by messing with its power or by reflecting it off a vibrating mirror. That would provide a tone to help "tuning" at the receive end. (You can also modulate voice onto light with similar techniques, but who's going to want to send code when they can talk?)

To Nick Sayer et al on 10 ghz microwave links.
Several years ago, K3PGP and I had a 10Ghz microwave link between our locations which was 6.3 miles. We were line of sight. I used a 10mw Gunnplexer mounted on my tower in a plastic food container, while John's site had the Gunnplexer mounted on his tower at the focal point of a 3' dish. He also used 10 mw of power. This link was active for nearly 3 years, and we had one full motion duplex video link (2 links) and on one of the video links we also had a voice nad data link, full duplex. The r.f. and i. f. units were all home brew by John, K3PGP, and they worked without any problems over the 3 year period.
Fog caused sparklies in the video, and heavy rains wiped out the link totally. Other weather conditions were seen to cause multipath distortions. Snow did not seem to have much of an effect, although in heavy storms, some loss of signal resulted. By the way, you have never heard audio that can be had on 10Ghz, try a 150 Khz bandwidth channel for audio.
The secret of these links were the home brew i.f. systems, which were on the order of 36mhz bandwidth. This allows video and several big bandwidth audio and data channels to reside on the subcarriers of the video channel.
If you guys want a tip... buy an old 70Mhz i.f. Satellite receiver and use this for the receiver. You have the video bandwidth and the subcarrier channels already there....
Also, good luck on the AFC system.... Unless both systems are locked up by a good AFC system you may as well forget it. The system PGP used was proprietary, and it worked great at -14F and +98F. If you want to have a lot of fun, try 10Ghz. No QRM, no Tuner uppers, just find yourself a buddy who is line o site and have at it!!!!

Why bother with BFOs. Just build a little audio oscilator (or
put a little feedback into the AM Modualator) and run Modulated
CW. Why make it any harder than necessary?? If the interest is
there, you will be moving them to Ham radio soon enough anyway.

Amidon (see ads in QST) has several types of ferrite rods, including
high-mu ones apparently intended specifically for LF/MF frequencies.

Anyone who wants to do controller work had better KNOW hardware. If you
aspire to be a SBC programmer, you'd better subscribe to the EE trade
rags and learn about the hardware or you'll never have a sucessful
software product. There's no OS to shield you from the dirty details,
you have to do it yourself. You'll be debouncing contact closures, driving
relays, and trying to debug why all the !$%& relays glitch every time
you reset the cpu. I know, I've been there.

>As to getting my hands dirty with assembly language, it's MUCH better
>than getting them bloody with BASIC. If I want a high level language,

>back the ROM chips with the BASIC interpreter on them.

Such chauvinism! Many of the controllers have 1 or 2 Mhz clocks, yet the
optimized Control BASIC that is built into the chips can do some mighty
serious real time control in the available 2k of on chip RAM. Tokenized
interpreted Control BASIC programs are often more compact than Forth
or assembler while being much easier to prototype and debug. Controller
BASIC allows you to vector interrupts directly to lines of your program.

Controller BASIC gives you direct access to hardware timers and ports at the bit level. Assembly can always be called inline for the really time critical things. C and Forth are available for some of the SBCs, but you usually have to expand to off chip ROM and RAM to use them. Since it usually only takes one cpu cycle to fetch on chip code while taking several cycles to access off chip code, you pay a heavy price for using bulky C code. The stack architecture of these controller chips is not optimized for C and calling a function and passing it parameters is very clumsy and slow. You have to forget what they taught you in school about modular code and write nasty spaghetti code hoarding every cycle. Often a little rethinking of your problem will give you a one chip hardware addition that saves hundreds of lines of code. When doing SBC work, hardware and code are best thought of as intimately interdependent parts of the whole solution to your control problem.

>

I have seen the 'instructions' for opening up the transmitter on the
IC-24... the instructions look believable so I beleive that it can be done.
I don't remember the transmit range either (sorry).

The user must install two (I think, this is from my memory) surface mount
diode arrays.... one array has two diodes with the anodes connected in
common to a lead (this is a 'three' lead device)... the other array has
the anode of one diode, and the cathode of the other diode connected to
the common lead.... Of course, you then need to know where to install these,
they are installed on the CPU board... near where the diode is removed to
enable the cross band repeat... There could be a little more to the 'mod' than
this... but again... this is from my memory, so there are NO guarantees to
the acuracy of this information.

Sorry.... I don't have the instructions..... But I will tell you that
the person I saw that had them got a copy from a major Ham Radio chain.
I assume that they will only give out the information to those who purchase
the radio from them ('tis only fair)... The first two initials of the
chain has already been mentioned... Don't tell them that I sent you!!!

Rich

REMEMBER: I don't have a copy of these instructions... Please DON'T email
me regarding these instructions.

>have to dirty your hands with assembly language.

Hmm. I CAN NOT in good conscience suggest that ANYBODY fool with BASIC unless they're SURE the project is SO small that it's REASONABLE; otherwise, when BASIC decides to garbage collect (or equivilent idiotic operation) and things grind to a halt, you'll wind up frustrated.

However. The 8051 family of microcontrollers by Intel is nice; my friend Mike and I are building a keyer out of one. For <$50.00 in parts and a little bit of planning, we will have a keyer with 4Kbytes of battery-backed up memory and an LCD display (for telling you what's IN the memories).

The 8749 is a version of the MCS-51 series (where the 8051 comes from), that has an EPROM built into it. It's QUITE reasonable to buy an 8749 for $15.00, a crystal for $1.00, and build a repeater controller for under $30.00. Think of the countless microcontroller projects that can be dreamed up! Callsign displays, weather stations, touch-tone pagers/decoders -- you could scare up a RTTY receiver with a display for under $30.00 in parts and do it in software!

I wish I know more about radios and how they work ... but it's easy to think of myself as a homebrewer, not afraid to try anything in the digital genre. Maybe I can convince others to do the same :-)

Source record: 8855

> Has anyone ever seen/used a DC adapter for the 470 that allowed
> operation at 5W

Dunno about the 470, but my 411 runs just fine using a 6-pack alkaline battery case with a couple of wires routed out to a cigarette lighter plug. Gets a little warm on high power!

The radio is rated at 5-15.5V, and it works. It's a shame they didn't throw an external 13V jack on the unit, to avoid having to switch bases.

870. Yaesu FT411 mods: warning

Newsgroup: rec.ham-radio
Date: 1990-09-04 17:08:56 UTC
From: ajs@hpfcdc.HP.COM
Message-ID: <7880268@hpfcdc.HP.COM>
Source record: 8854

If you have a Yaesu FT411 and you do the mods, beware that you will lose ARS and auto-leading-1, plus erase your memories. Here's an annotated version of the mods information, with some missing information the original author apparently thought was too trivial to record (sigh). I mailed a copy to Bramwell.

Date: 16 Feb 89
From: rfc@briar.philips.com (Robert Casey;6282;3.57;$0201)
Subject: FT 411 mods [comments added by Alan Silverstein]

copied from packet:
Msg# TSP Size Read To @ BBS From Date Time
24250 BN 2876 1 YAESU 4X6TL 890208 1513
Subject: FT-411 Modification.

From: 4X6TL@4Z4SV

FT 411 OUT OF BAND MODIFICATIONS

1. Open the front cover.

(This was one of the hardest steps!

Yank off the three top knobs. Remove all five top screws, the two side screws, and the four screws holding in the battery plate. Carefully pop off the top cover (there's a catch) by prying with a small screwdriver at the front left. Slide off the complicated top rubber gasket. I removed the PTT gasket and the carry strap too, but there's probably no reason to do so.

Now the unit should fold open from the left into two halves joined by fragile ribbon cable. The carry strap T bar will fall out; remember to put it back later.)

2. Locate the CPU unit (it is located on the front cover).

(There's a large copper sheet over it, with ribbon cable coming out the left side.)

3. Locate jumpers 1, 2, 3 and 4. These are the band setting jumpers.

(They are at the lower left of the copper sheet, each a pair of semicircles of copper on the epoxy board, separated by small gaps, with white numbers above.)

4. Jumpers 1, 2 and 4 should be disconnected, and jumper 3 should be connected.

(In my (US) unit only jumper 2 was soldered across. Removing the solder on jumper 2 was easier than adding some to jumper 3. It's hard to reach the jumpers. I held a piece of wire with pliers and touched the iron to that. I was sure to ground the iron to the chassis before soldering.)

5. Close the radio.

(Whew!)

6. Apply power to the radio and turn it on. The display will initialize with memory 1 flashing and the frequency display will show 1.000.

(And you can set any numeric value, it seems, even silly ones, using the dial, arrow keys, or keyboard.)

7. Now, adjust the display to the desired lowest receive frequency. When done, press VFO. The memory channel will now show 2 flashing.

8. Adjust the display to the desired highest receive frequency When done press VFO. The memory CH will now show 3 flashing.

9. Adjust the display to the desired lowest transmit frequency. When done, press VFO. The memory channel will now show 4 flashing.

10. Now, adjust the display to the desired highest transmit frequency. When done, press VFO. The rig is now set for your programmed band on transmit and receive.

(It worked! BUT, I lost two features:

1. ARS (auto repeater shift) is now absent. Apparently jumper 2 sets the US band plan and related features, as a package.

2. Now have to type in the leading "1" for all frequencies, where before it was automatic.

Also, the processor did a coldstart -- all memories lost.)

COMMENTS

1. After the rig is programmed to the band and you want to change it to other ranges, you will have to open the rig again and disconnect jumper 3, then to apply power to the radio, turn it off again, open it again, connect jumper 3 back and repeat from steps 5.

(Not very likely I'll ever do that again! -- ajs)

Our repeater group is using a 35A at our site. We have found that the wildly varying AC flucuations at the hilltop cause the Astron to crowbar (less than 1VDC at the output and hot hot hot heatsink). We now employ a timer that every 6 hours cycles the AC off (to the Astron) for 1 minute. B4 this timer we would have to go to the hill to cycle the supply off of the battery back-up.

Regarding HF-6V Butternut verticals.

I have had a HF-6V up for a year now and it has worked fine. I have not compared it to a dipole. On 40 meters I have 2 elements at 70'. I don't usually operate on 40 on the vert (only when the tower is down). There is a substantial signal difference (as one might imagine) between the two antennas. However, out of curiosity I have checked between the two several times. I can hear the majority of signals on the vert that I first find on the beam. The biggest exception is for European and deep South Pacific stations. Which I cant hear on the vert. For USA and South America the vert is fine. On 80 meters working the Carribean is a struggle on the vert and forget Europe (from the West Coast that is).

The vert does require a ground radial system. I have a six radial system with several more short radials. Two of the radials wind around the yard to get me 160 meters. (on 160 I have worked only north America and Hawaii). Until I got a decent ground I had RF in the shack and bad problems keeping the computer stuff working. If you can't get in a ground radial system then use dipoles.

I found the Butternut to be mechanically satisfactory and easy to set up. For North American contacts I have been fairly pleased with its performance.

If you are thinking about only 40/80 then you might think about the HF-2V. Its longer length will work better on 80. Buy the 160 coil too, you can have fun there too.

Regards, Dave

I just went thru the process of getting CA HAM plates for both my wife's and my cars. She is N6WSH and I am N6WSG.

After much confusion with the DMV people, my plates have arrived and my wife's have not. The fee was $21 each car. There is no other yearly fee. There is a $9 fee to transfer the plates to another car if you should buy a new one. It is not too supprising about the confusion over $20 vs $21. The form you fill out says $21 but the 'how to process this form' book that the DMV people use says the fee is $20. The lady helping me asked her supervisor which was correct and they finially decided just to charge the higher fee :-)

The main problems I had were:

* Confusion over both my wife and I getting plates. I tried to avoid this potential problem by submitting the applications seperately thru the 'drop off box' an the DMV, but they combined the two applications and sent them back with a note stating that there could be only one plate issued.

I later solved this problem by submitting my application again and then submitting my wife's about a week later. This seems to have worked although we do not yet have the plates for her car. (We have the new stickers and registration however.)

* Application form does not indicate that you need to send in a copy of your registration. DMV says they need it. I made copies and re-applied. I included the suggestion that they change their form to indicate ALL needed information rather than just some.

* They wanted my current plates. Again the form does not indicate that this is required. I never did give them my old plates, and I also never signed anything saying that I would turn them in later. I now have two sets of plates for my car. I am not sure what happened here. I applied thru the DMV drop box to avoid having to talk to the DMV personal. If you talk directly to the DMV people they do want your plates. I didn't want temporary plates so I used the drop box.

Map error is intriguing! I wonder how many people (like me) who live close to the state line really aren't living in the state they think they are.

[When I'm in a mellow mood, ask me about the Ohio-Michigan War of 1837, as a result of which the state line was moved several miles north. My town went from Michigan to Ohio.]

From: jneher@tenorman.Eng.Sun.COM
Message-ID: <141793@sun.Eng.Sun.COM>
Source record: 8844

Hello,

I recently purchased a rig that includes 6 meter capability
(Icom-726) but I don't know much about it. I've scanned the
ham portion of the band at various times of day and night and
have not heard anything. I've heard what sound like
commercial communications below 50 Mhz as well as telephone
conversations between 46 and 47 Mhz. Can anyone tell me more
about what I should be getting between 50 and 54 Mhz as well as between
46-60 Mhz? Do any books outline the activity there? I
know there exist FM repeaters in the ham portion
and some SSB activity below 51 Mhz. but I haven't heard anything yet
(and yes, I do have an antenna at least for receiving).

Also, I'm interested if anyone has any suggestions about
antenna design (base station) or a good inexpensive commercial product
for 6 meters?

Thanks in advance,

Jon Neher

I don't mean to pick on you, but... this sort of note isn't helpful. Rumors, particularly extravagant ones, have a life of their own. Unattributed and unsupported stories have a tendency to spread and be mistaken for reality. The more removed from reality they are, the more likely this is to happen. The current ecofreak/deep-pocket-suing world is making this all the more likely.

There have been a few articles on this topic recently. In the past year or two, there was a detailed article in QST, with lots of references to professional literature, lots of caveats in all the right places, and so on. That was really useful. It helped distinguish what is known from what is merely suspected from what is known to be nonsense.

From what little I remember of the article right now, I'm suspicious of the headache story. I could believe it if reproduced in a double-blind test; without such a test, the psychosomatic explanation remains a good one.

Excuse me? "US Sprint"'s Military Affiliate Radio System program? Last
time I looked, MARS was run by the Department of Defense!

> The MARS program, which uses a combination of amateur radio
>operators and US Sprint's digital fiber-optic long-distance network, has
>been used as a calling program for military personnel for seven years.

Well, *this* is almost right. Sprint has been kind enough to grant us
free use of their network during holidays for seven years, but MARS phone
patches have been going on for a lot longer than that.

> Medical calls from the hospital ships ``Mercy'' and Comfort'' and
>all emergency calls put through by the Red Cross will be completed for
>free, company officials said.

(quotes deleted)

> Under the program, amateur radio operators in the United States
>will receive calls through MARS radio carrier signals in the Middle
>East. The calls then will be put into the US Sprint network and routed
>to their destination without charge.

This should say "MARS affiliate operators" (hams, of course, but they're
talking about MARS patches, so the term should be that).

> The MARS program has allowed military personnel to place free calls
>on Christmas, Thanksgiving, Independence Day and other holidays.
> US Sprint is a unit of United Telecommunications Inc., which has
>headquarters in Kansas City.

This is not a flame against Sprint; we're grateful for their help.

But why in the h*ll can't the press cover technical topics without totally screwing them up?!

The main problem with CB is building a DF loop, buying a 55 gallon
drum of mouth soap, and using these to clean up the act of the
existing residents. The regular CB band is not the sort of
thing you want to expose Cub Scouts to.

Subj: What's a Techie? (followup)

Thanks to all who responded. I guess I'm a closet techie, after all, even if I do support the CW requirement. I guess the fact that I have built my own transmitter, and modified some military gear to operate on the Ham bands, and constructed my own working antenna from plans in the ARRL books also qualifies me for the title "homebrewer" also. Darn, I still haven't learned how to build a TNC, though, so I'll just have to go out and *gasp* buy one.

Seriously, I do think that a good portion of the fun to be derived from Ham radio is in the building of equipment and the satisfaction that you can get it to work (even if it takes much "debugging"). I'm grateful that we have some airspace in which to do this, especially with transmitters that can put out more than 100 mw of power (up to 1.5 KW) right out of your own brain/junkbox/workbench!

I'm with Myron: Homebrewing is building something, not connecting store-bought stuff together.

73, Dube N5PDK

PS: "Store-bought stuff" is functional stand-alone equipment, not basic components!

I'm curious about this. I have never got a headache (that I remember) from
an HT, however, I do remember a time when using a radar gun in a car that
caused a problem. I had been using it for a few minutes and had a mild
headache. I picked up a friend of mine, and he played around with it
for a bit, and soon said "Boy, do I have a headache all of a sudden." I
put 2 and 2 together and thought that maybe it was from the gun, although
I seriously doubted it. Anyone have any other experiences along these
lines? Note that it wasn't being pointed out the window, not at us.
"Believe it, or not?"

883. Mag Mounts vs. Holes

Newsgroup: rec.ham-radio
Date: 1990-09-04 21:57:27 UTC
From: DXANDY%widener@UCSD.EDU
Message-ID: <5A090410322403D9-MTABWIDENER*DXANDY@widener>
Source record: 8835

Hi!
I just installed a 2m rig in my car this weekend. I definitely didn't want to drill any holes in my car and I didn't fancy the idea of a mag mount making a mess of my paint work, not to mention the messy wiring that would entail. I decided to go with an AS on glass antenna. Installation is a piece of cake. It took about 10 minutes. The performance might not be as quite as good as other antennas, but it works well enough for me.

Look through Circuit Cellar magazine, for example. Or to quote a data point,
try looking at pg 60 of the 1990 Active Electronics catalog: there is a
68HC11 single board machine w/monitor, i/o ports, etc for $168.11.

Or course, you could go even cheaper by whipping up your own controller
based on the 68HC11 - the parts go as cheap as $10.90.

While a punch works, it just doesn't have the thrill of using a hole saw. With the hole saw, you have to be careful about drilling through the ceiling material. You also have to keep the hole cool while cutting it, or the slug will drop onto the ceiling material. I have a friend that had a meltdown that way.

There is a commercial outfit here in town that lends their cordless drill and holesaw to hams.

889. Summary of responses - ASTRON power supply failures due to RF

Newsgroup: rec.ham-radio
Date: 1990-09-04 23:27:31 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Sep4.232731.16370@midway.uchicago.edu>
Source record: 8847

Dear net people...

Thanks alot for all the replies people sent to me via e-mail and as replies to my posting.

I get the message! Everyone has confirmed my suspicion that the "shutdown" of my ASTRON power supply was caused by large RF in the vicinity. And this being casued by high SWR in the process of antenna matching via my MFJ antenna tuner.

Most people told me that the Astron was able to recover by powering off and then on again. This didn't help me. My astron is dead and currently out for repairs. Should be back in a few weeks... and I'l post info as to what was "blown" and how much $$ it cost to get it fixed when it comes back.

From the number of replies I got, this Astron "shutdown" seems to be a common problem with many people. If you don't have this problem you're in good shape... but you might want to be aware of these potential problems.

Maybe the ASTRON people should warn you about this. Or, maybe every ham except me knows about this "RF" problem with power supplies.

Below is a summary of all the replies I received, via e-mail and otherwise.

Live and learn....

Original note follows.... Replies are delimited by //////////////////////'s
---
From: gary@ellis.uchicago.edu (gary buchholz)
Subject: Weird Shutdown of my Astron power supply while antenna tuning (RF?)
Riddle me this...

I have an Astron RS-35M power supply (12v @ 35 amps). A few days ago, using this with a HF rig,I was "tuning" my dipole with a MFJ 949D tuner II at low power (about 5 watts). In the course of setting the inductor selector and antenna matching capacitor on the MFJ tuner the Astron simply "shut down". The Astron has amp and volt meters and the voltmeter which always reads 13.8 volts was reading only a few volts. I shut the Astron off, turned it back on, and agin it showed 13.8 volts. No fuse was blown, no smoke.. and I doubt that in the course of tuning by transceiver it was pulling no more than about 3-5 amps.

This happened a few times. Each time I turned the Astron off and then back on and it was fine. Three times and I gave up since I knew something had to be wrong.

Tuning another antenna this evening (a long wire) it happened again. Low power, CW, key down, 5 watts and the Astron shut down - this time for the

last time. It didn't recover. Its "red" power light is on, no fuse blown
but no voltage.

My guess is that the problem has something to do with RF getting in the
power supply - what else could it be ? Clearly, pulling a few amps for
antenna tuning wouldn't burden this 35 amp supply and no fuse was blown.

Looking at the schematic of the power supply I see 3 curious capacitors
in various configurations on the heat-sinked power transistors with the
note "C7-C9 added for R.F. bypassing".

What does RF have to do with a power supply. And, why has my Astron "shut
down" on such a low power demand ??????????????????????????????????

Wondering....

Anybody got an answer.... or a guess ?
Gary (N9KAW)
//
From: jpd@pc.usl.edu (Dugal James P.)
Gary, the Astron has an LM723 voltage reg chip (if I recall correctly).
It has sensing inputs to account for internal voltage drops. I bet RF
could confuse it to where it puts out less OR MORE voltage than desired.
If the voltage gets too high, a crowbar SCR will short to ground the output,
so as to blow a fuse. So if it's not the fuse, suspect either the SCR
or the reg. chip. Since the chip is socketed and cheap evan at Radio Shack,
try replacing it!
Good luck!

From: depolo@eniac.seas.upenn.edu (Jeff DePolo)
Most likely what's happening is that you have some RF floating around in
your shack and the diodes in the power supply's crowbar circuit are
rectifying it and causing the crowbar to clamp. You have to turn the
power off and then back on to reset the crowbar. You can help alleviate
the problem by installing a .1 uF cap across the positive and negative
terminals on the back of the supply for a start. The better idea is to
work on your antenna to get a better "natural" match without having to
use the tuner. The worse the antenna's match, the more RF you'll have
floating on the outside of the coax, in your shack, etc.

Welcome to the world of RFI!! I have an Astron 35 A supply, too, though
without the meters. When I operated on 40 m, it shut down, but recovered when

the RF stopped. My solution? Tear out Astron's regulator board and build the regulator for the 30 A supply in the ARRL handbook. I really tried everything I could think of before this with no luck whatsoever. The regulator I built from the Handbook works like a charm and is IMPERVIOUS to RF! Takes a couple of evenings, but well worth the effort.

I never tracked down what was happening, but in your case it sounds like the crow-bar overvoltage protect has tripped, which can only be reset by cycling the power to the supply. Good luck!

//
From: geertj@ica.philips.nl
All kinds of weird things happen when HF goes innto a power supply. Be glad the voltage didn't increase; I have seen that happen with a professional lab power supply (it wasn't a PHILIPS, if it matters..)

Make shure that no HF reaches the power supplies electronics.
Some toroids and a few caps of 10nf is usually sufficient. While at it, add a crowbar: a circuit with tyristor and zener diode that will SHORT the power supply when the voltage gets too high (mine usually go at 18V for 13.8V supplies. A fuse will do the rest, and save your rigs.
They smell real bad after overvoltage damage. Expensive too. It can always happen: I have had problems on a power supply that worked for years but didn't like the power we made during last JOTA..

//
From: swm@homxb.att.com (Scott W Mclellan)
Gary,
I have had the same exact experience. Due to a problem with my tuner, my rig was hot with RF. Either the RF caused the regulator in my astron RS-35M to increase the output voltage until the crowbar activated or the crobar was tripped by the RF. Turning off the supply reduced the output current so that the crowbar reset, and turning it back on returned everything back to normal. My solution was to ground the negative terminal of the supply to the Astron chassis and increase the bypassing in the regulator. The output of the Astron is floating with respect to ground (a couple of small bypass caps couple the output to ground - not enough in my opinion) so grounding the negative end helped a lot. I also increased the bypassing of the AC inputs and put a line filter with MOV protectors in there too. Not only did the RF sensitivity of the Astron decrease, but it is now less suseptable to lightning surges and the radiated noise from the transformer/rectifiers is a lot less (but thats another story). Also ground together the supply, your rig, and the tuner with a short braded cable coupled to ground (through as short a wire or braded cable as possible).
All ground cables should be as short as possible. Put toroid cores on the cables in and out of the supply. This completely solved the problem for me.
BTW, I evolved to a battery supply now instead of the Astron.
Great for emergency work and there is no way I can overvoltage my rig

now.
73 de ND3P
////////////////////////////////////
I have the same supply, but mine doesn't shutdown when I'm using my
MFJ tunner, it usually goes south when I power up my FT901 initially.

This is nothing if not a nuisance. I haven't looked for a solution.
I just sequence it off, FT901 on, then power the supply back up.
If you find an explanation I'd be interested.

73's de Steve KA6S
//
To Gary and his Astron power supply.

Yes Gary it is very possible that your supply shut down because rf was getting
into it. The power supply on my Drake TR-7 does the same thing when my antenna
is not tuned correctly and rf is in the shack. The capacitors you talked about
and I'm not sure from your posting if they were installed in your supply or not
are probably bypass caps to reduce the susceptability of your supply from rf.

It is possible that the power supply leads are acting as antennas and picking
up rf in the shack. Try to put a sleeve of ferrite over both leads. This will
reduce the common mode noise that is the rf common to the plus and minus
leads of the supply. If you need more info try to call me. I tried to
e-mail direct to you with no luck.

While I have no first hand experience, I have been told by several folks
that they've seen poorly constructed Astron supplies. One fellow found
the AC line wired backwards while yet another found an area that missed
solder completely!

Is it possible that maybe you've got a marginal connection in the
supply?

DISCLAIMER: I'm NOT badmouthing Astron. I'm just relaying comments I've
heard in the last few weeks regarding their assembly.

From: glenne@hpnmdla.HP.COM (Glenn Elmore)
I have an Astron (and schematic) at home too. So this *is* a guess.
I suspect that you could easily have generated some pretty big local
fields with the tuner and the longwire. The impedance of the longwire
could certainly have been high and that probably made for lots of

RF voltage in the shack. Whether this was coupled into the Astron via
the DC output leads, the power line or directly radiated into the
box I don't know but it probably was one of those. The source impedance
of the supply at RF is not guaranteed to be low (thus the extra bypasses?).
I don't know what the failure mechanism was exactly but I think it
is a series pass supply which means that the output might be pulled
above the desired regulated voltage. I suppose there is an overvoltage
circuit which could have turned on. I'm not clear on what the precise
failure sequence was but maybe there is a crowbar that got turned on
and the supply tried to source current into it and broke something.
With the RF present in regulator, over-voltage and over-current circuits
it seems like almost anything could have happened.
I hope it didn't over voltage your radio. I fried a 432 transverter that
way one time and I know of others who have lost HTs to the same fate.
Good power supplies are *not* trivial.

Sorry to post this, guys, but I can't email from this location.
To: Gary, N9KAW
Gary, I have had the same problem with my Astron 35M. The SCR in the unit
sees the RF as an overvoltage and crowbars, shutting the output down.
Turning the unit off and on again resets everything. I solved my problem
by wrapping the DC leads going to my xcvr around a toroid.
Craig, KA5BOU
//
I repaired an RS-20A once for a friend of mine who had the same
problem you describe. He was using it with his ICOM 751A. As
he raised the RF power on the ICOM, it would hit a treshold when
the power would cut back and the voltage from the supply would
drop.
The problem was one of the 2N3771 pass transistors (on the back heatsink).
The socket that encapsulated the emitter and base leads did not make
a very good connection and could not handle even a light load (like your
5 W situation). So, as a first look, check the connections to these
transistors.
Also, since these transistors are, in essence, connected in parallel, you
might try removing all but one (I believe there are 4 on the RS-35M?)
and see if your voltage returns to 13.8 V (no load connected). You could
replace one at a time to see whether one is not working.
Good luck -- hope this helps.
73,
Doug, WW6D
//
This is a common problem with regulated supplies. Especially with
long wire antennas, it is common to see RF voltages in the hundreds
of volts floating on the equipment. This is where having an effective

RF ground on the station equipment saves the day. The Astron 35M has
some RF suppression builtin. There should be a .001 cap across the
output terminals and one across the 110v line along with three MOVs.
Also there are three caps surrounding the pass transistors. Check
that these caps are there and are good. I recently had a lightning
strike come in and vaporize the cap across the AC line (and the MOVs).
Interestingly all four pass transistors survived, but the .01 ohm 5 watt
emitter resistors didn't. These act to equalize the current between
the pass transistors AND act as the metering shunt. These proved
impossible to get locally. One foot of number 20 wire has .01 ohm
of resistance and works nicely as a replacement. You may have blown
the LM723 voltage regulator in the supply with high RF voltages.
It can only stand 35 volts. Try replacing it (use a socket) and
be sure to check the caps and establish a good RF ground before
tuning up again.
Gary KE4ZV
//
From: mikey@pnet01.cts.com (Mike Shirley)
Our repeater group is using a 35A at our site. We have found that the wildly
varying AC flucuations at the hilltop cause the Astron to crowbar (less than
1VDC at the output and hot hot hot heatsink). We now employ a timer that
every 6 hours cycles the AC off (to the Astron) for 1 minute. B4 this timer
we would have to go to the hill to cycle the supply off of the battery
back-up.

But Item 1 will guarantee that no product will ever exist. Without a bundled
application that interests the armchair ham, no hardware will ever fly.
And if the hardware does come bundled with an application, then it
apparently won't qualify for your interest. Sounds to me like a PC with
a data acquisition card and maybe a smart async card will fit your bill.
That's about as standard a hardware environment as is likely to exist
in the forseeable future.

>> Do your own homework, phil. Check any issue of "Circuit Celler", "Embedded
>> Systems", "Measurement & Controls" (an ISA publication), "Electronic
>> Engineering Times" or any other trade magazine for literally dozens of
>> ads. The world is swamped with SBSs. HINT: The Micromint will sell

>These publications have stuff generally intended for hardware hackers.
>That's fine for hardware hackers who want to use my software. But what
>about the appliance operators, or more specifically, the high level
>network builders?

Maybe I lost track of the thread somewhere but weren't we talking of
embedded controllers for things like repeater controllers? I don't
read this thread much because it is mostly noise so I may have missed
something. If you are looking for network controller hardware/software
controller combinations, it is still hard to beat a PC with a smart
sync card. I just finished a system for a client in which we're
driving TWO 56kbps sync modems from Interactive Unix on a 386 PC
with 3770, SNA and RJE layered on top for good measure. The system
shows less than 10% additional load with both modems active. What needs
to happen is someone write driver code for the hardware that is available
now instead of just talking about it all the time.

>I've never heard of Micromint. Per chance might they have a 56001 SBC?
>You might also mention where these publications can be had, subscription
>prices, etc. I've only heard of "Circuit Cellar" and last I saw, it was

>person, NOT a hardware person. I don't get, or know about where to find,
>such things as EE trade rags and such. But I'm sure I can understand
>most of the tech talk in them.

Try your nearest university technical library in the periodicals section.

>As to getting my hands dirty with assembly language, it's MUCH better
>than getting them bloody with BASIC.

I think KE4ZV addressed this one adequately.

>If I want a high level language,
>I'll use C. Unless these SBCs typically run at 33 MHz or so, I'll have
>to go back to assembly to get the speed I want.

Say what!?! Look out beyond the PC bus world. A 2 mhz 6502 properly
coupled to a UART will easily drive a 56kbps channel or 2. I know
that a 10 mhz Z80 will. And any number of the speciality microcontrollers
will handle bps rates we're interested in with single digit clock speeds.
The world does not revolve around 5 mhz busses with 15 wait states associated
with every I/O instruction. The PC architecture was brain damaged when
it was conceived and 10 years of suffering has not healed any of the
damage. The ONLY thing it has going for it is it is cheap and available
anywhere.

>I do a LOT of programming
>in assembly language now and am very comfortable with it on several machines,
>so why should even consider BASIC? I hope I can get a refund for sending
>back the ROM chips with the BASIC interpreter on them.

Depends on whether you are programming just for the fun of programming or
whether you are programming with the aim of getting the job done.
If you aim to get a given job done with the minimum effort, then BASIC
(or maybe FORTH if you love pain.) makes a hell of a lot of sense.
Remember that you don't have a nice DEBUG command or even a TTY line
with these little processors. In the absence of BASIC with its attendent
TTY interface, you get to do things like toggle a bit on a port for every
pass through a routine in order to determine where you are in the code.
Not my idea of fun even with a moderately good function library available
to me. BTW, the BASIC or FORTH comes mask-programmed into the devices
so you can't get a refund. You simply buy a device without the BASIC.

I recently traded my IC 745 in on a new IC 735 and I am delighted. The receiver is great. The controls work intuitively. The transmitter is clean. It's small enough to take mobile or portable, yet the controls aren't cramped or difficult to use. It still has the transverter jacks on the back and has optional narrow filters and passband tuning. Short of the megabuck IC 781 or TS 950 you won't find a better rig.

894. Questions on setting up PK-232MBX, Kenwood 731A and Mac SE

Newsgroup: rec.ham-radio
Date: 1990-09-05 01:05:45 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Sep5.010545.17940@midway.uchicago.edu>
Source record: 8851
Cross-posted to: rec.ham-radio.packet,rec.ham-radio

I just got an AEA PK-232MBX Multi-Mode Data Controller and my intention is to use this with a Kenwood TM-731A (2m/440) and a Mac.

I though I'd be on the safe side and solicit the net ham-radio/community regarding this setup and any potential problems.

The AEA does not have specific instructions for the Kenwood TM-731A but the Mic wiring *seems* clear. But, on some KW models the recommendation is to add a 0.1 mf cap in series with the mic audio in. No reason is stated and my specific model is not addressed. Do I need this and what's it for ?

Also, the pins on my KW are as follows: 1-Mic audio; 2-PPT(STBY); 3-Down; 4-UP; 5-8v/Max 50ma; 6-RX Audio output; 7-GND(Mic); 8-GND(PPT)

The AEA wiring diagram/cable wants a "brown" connected to the "common" PPT and Mic ground. But, these are 2 separate pins on my mic connector. I took a VOM and found that pin 7 (GND-Mic) and pin 8 (GND-PPT) seems to be tied together internally. Further, the AEA guide recommends connecting the cable shield to pin 7. This leads me to believe that "brown" and shield should all be tied together to pins 7 and 8.

If someone could help me out with this - I'd appreciate it.
=> Do I need any 0.1 mf cap in the circuit ?
=> Are pins 7 and 8 wired together in the Kenwood ? My VOM seems to think so, although these are separate pins with separate designated functions as diagramed in the KW manual.
=> On the Mac serial interface. Do I need all the pins connected (1,2,3,7,8,20) or can I get away with just 2,3 &7 (transmit, receive, ground)?
=> Will I have a problem with "switching" times on the Kenwood?
=> What can I "blow up" if I hook this up incorrectly?
=> Any problems I should look forward to using the PK-232 ?

One other minor question, the Mic input impedance for the KW is 500-600 ohms. Nothing is said on the AEA specs about audio input levels or impedance matching for their AFSK output from the PK-232 into the transceiver. Isn't this important ? I would think so, the wrong impedance or "overdriving" the mic input, I would think, has the potential to doing some damage to the transceiver audio pre-amp/front-end... Right ?

Thanks,

895. Base Unit Advice?

Newsgroup: rec.ham-radio
Date: 1990-09-05 06:23:26 UTC
From: tjm@sei.cmu.edu
Message-ID: <8477@fy.sei.cmu.edu>
Source record: 8865
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Please excuse my ignorance. If this subject is not appropriate
for these newsgroups, please point me in the right direction.

I do some hunting in the Laurel Highlands of Pa. Last deer season
we decided to pick up a few FM band walkie talkies to help us
communicate when we're out and about. They were inexpensive,
so we bought four of them. (We picked them up at a "hick" Radio
Shack/Variety store and made a deal with the owner.) These are the
small, pocket sized Realistic brand.

What I am interested in is whether or not we could find an inexpensive
"base unit" for the non-hunters in our group. Ideally, I think it
would have to be powerful enough to reach a 5-10 mile radius from
the cabin. Another potential problem is the mountainous terrain; we
have had problems in the past with transmissions from one side of a ridge
to a valley.

My questions are: Is there a "base unit" available in the same frequency
range powerful enough for the mountains? (BTW, the
sides of the boxes say 49MHz.)

My friend that owns the cabin recently picked up what
he describes as a base unit.(garage sale) Is it possible
to change to the same crystal as the walkie-talkies?
Assuming, of course it has one. Additionally, if this
works, how can you boost the output? Do you just try
to place a large antennae as far up as possible?

Even though all four of the folks using these radios
won't be able to talk to everyone, I'd like the base
unit to reach them individually. What would be the
best, inexpensive way to do this?

Any help, advice, pointers, greatly appreciated. Please respond via email
if possible. If you need more info, I'll be happy to supply it.

Thanks for the time and consideration.

Ciao,

Todd

This is from the icom "translated fax".

Usable ranges after the mods will be:

RX: 114-130, 138-192, 403-485 & 825-903
TX: 138-168, & 410-485

In reality I have seen a great variance between different radios on where they actually lock up but I have been impressed at the capabilities of this radio

I assume you already have done the kbd mod for the out of band recieve so I will skip that part.

Order the diodes from Icom, part number 912-06015. They are about $2.50 each. A lot for a diode but not for a mod. These are tiny tiny surface mount dual diodes. They have three legs each and I forgot to see if they were common anode or cathode. Be safe and order the right ones from Icom.

Open up the radio. Clip out the glass diodes D13 and D14. D13 should already be out to enable the rx mod but D14 will enable cross band repeat. Func-C,5,D will activate the cross band repeat between two *simplex* channels.

Install the two diodes at position D7 and D12. The picture below may help find them.

I used the hottest and tiniest tipped iron I could find, tweezers and magnifying glass. Be extremely careful adding these diodes as I have seen how easy it is to lift an etch.

>How about light-wave communications? Photodetectors and flashlights

I suspect a flashlight could go a long way on a clear night. Right now, I am working on my novice license, and I am very close to solid mastery. With a flash light, and key wired in, I suspect you could get out 2 mi of long distance. Problem is, you would not be working with sound, and filiment heat up and cool down time will slow you down.

I live enar a major port on the East Coast, and I was thinking that it might be interestig to try and signal ships comming over the horizon using car headlights (with a real key wired into the circuit) or just a flash light. I wouldn't try it until I fully UNDERSTAND MARITIME SIGNALLING protocols though. It wouldn't due to send misleading instructions to vessles in shallow water like that.

Progress continues on obtaining parts for the microwave internet
link. Current plans are for working under part 15 rules on the
K band (24 GHz). Anyone with a description of the procedure
for obtaining an experimental and/or educational license for
another microwave band (or preferably the same one), please
let me know. If there is a demand, I will summarize.

My appologies if this is begining to stretch the intended subject
matter of this group. I can't think of a better place to go.

Message-ID: <1990Sep5.161827.28172@ecn.purdue.edu>
Source record: 8870

Regarding extremely simple light-wave communications, headlights
and the like, here is one data point:

Jim Schreckengast (now N0HAP) and I tried this, coordinating via
2m FM. The "transmitter" on each end was a single automotive headlight.
He simply pointed the car in the right direction, and had a friend stand
in front of the unused side. I had a separate lamp, a spare headlight I
had mounted in a toilet plunger with a cord going to the lighter plug.
Looked odd, but made for a bright, cheap, hand-held emergency lamp....
Anyway, "modulation" was done by a shield, *not* by cycling the
power to the lights. I would suspect your baud rate would be seriously
limited if you keyed the power (there is a noticeable decay time), and
your headlights might not like such treatment. I suppose you might
rig up some sort of Aldis lamp contraption if you were serious.
At any rate, what might be the most interesting was the QRM we
dealt with. The distance was only about 1.5 miles, but we were on the
sides of hills on either side of a valley. So, all around and behind us
were other lights from cars, building windows, etc. Even with what would
be an extremely low SNR (if you figured signal light flux and "noise" light
flux within some solid angle), we had error-free communication. I imagine
we had around 5 WPM, since that was as fast as we could accurately wave a
cardboard shield back and forth.

At a dark site, with no moon and with your eyes dark-adapted, I'd
like to see just how far a simple flashlight could be used.

Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Does anyone have the format of the AEA pk232 commands that can be
exchanged in "host mode". It apparantly is in the technical manual
but alas I dont have it.
I would like my computer to talk to the pk232 at a lower level than
the normal method. I would also like to identify the source of the
stuff that comes back for the unit.
I would think the commands stay the same but are preficed with some
header.
Thanks,

On the topic of small HF rigs: Does anyone have any info on the forthcoming Delta II from TenTec? It looks like this rig will blow away my Kenwood TS440S based on the published specs. There's also a QRP version of the same rig (the Argonaut II) which looks very interesting. They are both due out in the fall.

I would be interested in ballpark price and any other info on these guys.

(603) 881-0503

In article <141793@sun.Eng.Sun.COM>, Jonathan Neher, N6XUI, was asking what the 6m was
all about.

Well, you could pick up a copy of scanner frequency listings locally for the stuff between
about 46 and 50MHz. I don't recall off the top of my head if there are any Federal Govern-
ment segments wedged in there, but I do remember that many of the channels between
46.0 and 47.0 are allocated to Public Safety, such as Fire and Special Emergency (Ambulance/
EMS, etc.). The chunk between 49.6 and 50.0 used to belong to the Feds, and was used by
the various MARS groups, but it has since been given over to the cordless telephones.

The ARRL has published a band plan for 6m, and it's printed in the ARRL Repeater Directory.
However, I've paraphrased it below for your convenience. You should double check the FCC
Rule Book and other amateur publications to ensure you're operating legally.

(Some of the segments overlap slightly - there may be some local gentlemen's agreements)

50.0 - 50.100 CW ONLY (FCC RULE !)
50.060-50.080 Automatically controlled beacons [List in ARRL Rptr Dir]
50.1- 50.600 SSB/AM
50.110 SSB DX calling freq. (pls move off once contact made)
50.200 National SSB Calling freq (Move off as above; down for DX, up for local)
50.400 AM calling frequency
50.600-51.0 Experimental and Special Modes
50.61-50.78 Meteor Scatter/Duplex, paired with 51.61-51.78
50.70 RTTY
50.8 - 50.98 Radio Control (of models), channels on 20(?) kHz raster.
51.0 - 51.100 Pacific DX window
51.1 - 52.000 FM Simplex and special modes
51.61-51.78 Meteor Scatter/Duplex, paired with 50.61-50.78

51.700 National Packet calling frequency
52.00 - 52.05 Pacific DX window
52.05 - 54.0 FM Simplex and Repeaters, 20 kHz raster starting on "52.01"
(grrr...),
Repeater Split 1.0 MHz, high-in vs. low-in check locally
52.49, 52.51, 52.525 FM Simplex, '.525 National FM Calling Frequency.

The September VHF contest is this weekend, September 8-9th starting around
1900UTC
Saturday, and running past my bedtime Sunday night. You might want to listen
between
50.000 and 50.300 for the contesters.

908. Inductance of ferrite-rod loop antenna?

Newsgroup: rec.ham-radio
Date: 1990-09-05 19:32:49 UTC
From: gopstein@soleil.UUCP
Message-ID: <1107@soleil.UUCP>
Source record: 8778

I am trying to build a resonant ferrite-core loop antenna for reception
of Loran-C (100kHz) signals (for fun). The problem is in determining
the inductance of the ferrite loop.

According to the ARRL Antenna Book (15th Ed), the inductance is:

L = (4*pi * N*N * A * Mu_rod) / l

Where
L = inductance in Henrys
N = Number of turns
A = Area of a loop (in cm*cm)
l = length of core in cm
Mu_rod = permeability of the rod adjusted for length/diameter ratio.

From the Amidon catalog, the permeability of one of their ferrite rods
is 850. When adjusted for the length/diameter ratio according to the
table in the ARRL book, Mu_rod is about 100.

So, the inductance for a 7.5 inch long .5 inch diameter loop with 20 turns is:

L = (4*pi * 20*20 * 1.61 * 100) / 19

= 42593 H (!)

This CAN'T be right. Are the units supposed to be meters instead of cm?
Is 100 a reasonable number for the permeability?

Thanks.

From: gb@sunpix.East.Sun.COM
Message-ID: <5200@sunpix.East.Sun.COM>
Source record: 8861

I want to measure the complex impedance at the input of my HF antenna.
I've tried the typical cheap noise bridges that are available and have
not been satisfied with the accuracy or the range of the measurements.
What should I use?

A General Radio Impedance bridge sounds seems like a step in the right
direction but it is big and the used one I saw at a hamfest was $450.
What do these things cost new?

Is there a more modern way to do these measurements?

Source record: 8863

Here's the story: Lightning struck down at my qth, broke my tnc and
the interface inside my Kenwood ts-790a. Both main and sub audios are dead.
No output to the tnc. Anyway, I looked up the components which are likely to
have broken. They are two transistors: Q15 and Q16 on the main circuit board
(IF UNIT X48-3050-00). They turned out to be surface mounted transistors and
probably due to space limitations none of the surface mount components are
marked on the pcb. In other words, I have no means of finding out exactly
where they are located on the pcb, since it's got about 100 surface mount
transistors. Perhaps someone's got a service manual from which one can see
the actual location of these components?
Thanks in advance!

923. FT470 mods

Newsgroup: rec.ham-radio
Date: 1990-09-06 12:47:28 UTC
From: prs@oasis.icl.stc.co.uk
Message-ID: <1508@ozz.oasis.icl.stc.co.uk>
Source record: 8872

Hello FT470 owners... I asked a few weeks ago about mods for the
FT470 to make it receive and transmit on additional frequencies.
I own(ed) the European version which caters for 144-146 & 430-440.
It now transmits and receives 140-174 & 430-440, with additional
receive coverage 440-500 MHz! The mod was fiddly as the chip resistors
are the size of a pin head. You'll need a fine tipped soldering iron
and about 2 hours of patience. Here's how I did it...

For 2 metres.. locate R66-69... R69
which are located at 10 O'clock |
to the lithium battery. R68-(lithium
R69 is vertical, R66-68 are R67-(battery
horizontal. R66-(cell

The combination you want is: R66 & R68 = 0; R67 & R69 = 1.

Mine came with R66 & R69 set for Europe so I just moved the resistor from
position R66 to position R67.

For UHF, locate R70-72 to the top left of the ribbon cable. These are
vertical and in the order:

R71 R70 R72

The combination you want is: R71 & R70 & R72 = 0.

Mine came with R71 set for Europe so I just took the resistor out and have
stuck it to the back of the battery (in case I need to convert back).

If anyone disagrees with these mods and think I've done something wrong,
let me know a.s.a.p.

Cheers & 73

[crazy picture omitted to save space]

>Would something like this work? Yes? No? Why?

When I lived in an apartment (i.e. until 1 week ago) I tried all kinds of crazy stuff like this ... my favorite method was to run a long wire along the ceiling, 1/2 way around the room (in other words, from one corner to the opposite one), and down.

I'm pretty inexperienced when it comes to antennas, but my thoughts on the matter are that some sort of tuner is necessary (I spent ~$100 for mine - I specifically looked for one that tuned random wires), and that random sorts of wires work best if you pick one plane and try to stick with it, or at most two planes.

On the other hand, I *NEVER* had good luck with indoor dipoles; they would only tune with the transmatch with great difficulty. This suggested to me that the effeciency of the operation was very low.

Another neat effect to watch out for: in one RIT apartment complex, 10 meters at a few watts *WILL* set off the fire alarm :-) (I never tried to do it from across the street :-))

73's and best of luck!

> The main problem with CB ...

The main problem with CB is that the equipment is naturally
a microphone environment. Once the Cub gets hold of a mic then
there is no reason to learn the code. Using the mic is easier,
more efficient and more fun than wracking ones brain trying to
decode code.

Try getting using the sic. Radio Shack Space Patrol walkies
at distances which prohibit voice communications. Better yet,
increase the feedback in their regens to the point where
voice communciations is impossible due to the detector whine.
They will be more sensitive and will provide an automatic bfo.

> collection on a microcontroller - what a riot.

John:

Perhaps you would be so kind as to explain why I got so many of these
garbage collection statements way back when I wrote basic (it was the
only high level language at the the time) for Commodore. I wrote an
editor in basic and garbage collection would occur and I would wait
for many minutes. I program assembler on fifteen different processors
the last time I counted, and have written code for more computers than
most people even know exist. I do not consider it to be a sin that
I do not either know or understand what you are talking about. How about
a little information and a little less snot?

Don't expect the same type of operation as on 2 meters or higher.

I have noticed that most 6 meter stalwarts either sit on
52.525 waiting for a band opening or talking about how terrible
traffic and the general state of American society is becoming, or
the local repeater run by one or two guys serves as a wide area
intercom system. Most systems are PL to prevent band openings from
bringing up the repeater.

Fun stuff, 6 meters. I remember the day I got sick of working everyone
in California from Washington D.C. after 5 hours and just
turned the radio off. :)

929. 2M HT - which one??

Newsgroup: rec.ham-radio
Date: 1990-09-06 14:30:58 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <06.Sep.90.15
Source record: 8791

Hi; I am planning to buy a 2M HT; anyone got any advice?

What I want::

1) Lots of RF output (3 watts minimum). Dont care about low-power position
because i doubt i would ever use it.
2) Big battery packs (enough to give 30+ hours on receive standby, 1 to 2 hours
on transmit without changing battery pack)
3) External 13.8v power lead for mobile use.
4) Battery chargeable from 13.8v mobile supply; radio useable while being
charged from mobile supply.
5) Splashproof, rainproof, drop-proof case, pine-needle-proof,
(diecast aluminium case and rubber seals ESSENTIAL)
6) High-selectivity front-end to prevent crossmod and image interference.
7) Robust belt-clip or shoulder-holster for carrying.

What i DONT want!

1) Wide-band coverage (either transmit or receive!)
2) Scanning or priority channel.
3) More than about 3 memories.
4) PL tone
5) Keypad frequency entry (they get damaged when sat on)
6) front-panel LCD frequency displays (they get smashed.....)
7) Hands-free operation, boom-mic headsets etc.

What I dont care about;

1) Weight (it will go in a rucksac)
2) Appearance.
3) Compatibility with any existing accessories (dont have any!)

I've been thinking of one of the Alinco DJ-series (DJ120) even though it has
a few things that i dont want. Anyone know if these are 'bomb proof' as far as
images and crossmod. are concerned?
Other alternative is an IC2 second-user, or a TH26.

What say you good people??

930. ABUSE OF HAM RADIO ETHICS IN talk.politics.mideast

Newsgroup: rec.ham-radio
Date: 1990-09-06 14:45:04 UTC
From: fergie@megrez.intel.com
Message-ID: <35@inews.intel.com>
Source record: 8790

The following is a posting I made on talk.politics.mideast.
This is in response to an obvious racist!
I do not think that ham radio should be used as a front
for some racist group. Ham radio should be used to
unite people.. not build walls between people.
****
I am insulted as an Amateur Radio Operator by the ARF
postings!!!

Amateur Radio is not , and was not intended to be used as
an identity for some RACIST NUT who identifies himself
^^^^^ ^^^
as: (ARF).Amateur Radio Forum (ARF) NR9Q

Amateur Radio is intended to bring countries and people
together.
I would like to give you a very good example!
in March 1990, in Torremolinos Spain at the international
amateur radio union meeting , a delegate from Israel
announced that the ban preventing Israeli amateurs from
talking to Arab nations had been lifted.
It was received with a standing outburst of applause.
The Israel hams, and also the Israel government are
setting an example of the way Amateur radio should be used!

You should also be aware that in many Arab countries
you can be hanged for establishing radio contact with
Israel. It is considered as "espionage" or treason.
Here is where I justify my posting as mideast.politics.
Why is it that just about every where in the world
Radio Amateurs are allowed to establish radio contact
and make friends over the air... but in most Arab
countries this is not allowed. (Jordan is one exception)

While I have not traveled as much as many people on
the net, I have been around and have talked to many
Amateurs in the world, both in person and on the air.
This attitude is NOT prevalent among Amateur Radio
operators, so do not use Amateur Radio to identify
your Racist remarks!
^^^^^^
If you want to make up an organization to show how
big and great you are why don't you use the name
OINK for Obnoxious, Idiotic, Naughty, Kids. Think
of the large number of Naughty kids in the world! Much

more than the number of amateur radio operators.
This name would reflect more of the mentality of
your postings, and at the same time afford a word
that would identify you in a more appropriate
fashion than ARF.
Unless the "ARF" stands for the barking sounds that
the mad dog that you are makes, please do not use Amateur
radio as a shield to hide yourself behind.

I offer my Apologies to any PIGS and DOGS offended by
this posting identifying Schmidling with them.

WA6BXP San Jose California

|> aren't cramped or difficult to use. It still has the transverter jacks
|> on the back and has optional narrow filters and passband tuning. Short
|> of the megabuck IC 781 or TS 950 you won't find a better rig.
|>
|> Gary KE4ZV

Nah, The TS-440s has more features and is a much better radio than the
IC-735...

Actually the TS-440s, IC-735, and FT757 are all in the same class in
both performance and price.

I prefer the TS-440s because of the internal antenna tuner, 100 watts
output 100% duty cycle, and the 100 memories. I feel that these are the
advantages of this radio.

On paper the specs of the ICOM radios look better but when the radios are
tested they are the same. I am convinced that ICOM uses a more optomistic
measurement method. I know this to be a fact when Hams tested the TS-950SD
to the IC-781 and IC-765. The Kenwood radio came right in on spec and the
ICOM radio was closer to the Kenwood spec than to the ICOM spec.

933. Re: How to measure HF antenna impedance?

Newsgroup: rec.ham-radio
Date: 1990-09-06 16:14:01 UTC
From: rkarlqu@hpscdc.scd.hp.com
Message-ID: <5490100@hpscdc.scd.hp.com>
Source record: 8876

One of the problems I ran into when measuring antenna impedance was that strong signals (especially the 50 KW BCB station 10 miles away) tended to overload the impedance meter or noise bridge. With the noise bridge you have the additional problem of hearing the noise above the QRM in the receiver. Finally, there is the problem of measuring the impedance at the antenna terminals (not at the transmitter end of the coax) which means you need a remotely controllable impedance meter that is portable enough to carry up the tower.

What I ended up with was a homebrew noise bridge with a high pass filter to block BCB QRM and a high power noise generator to overcome ham QRM. I implemented the "R" and "X" controls with varactor diodes so I could remote control it from the shack. I think I later saw something similar written up somewhere (QEX?) but I can't remember where.

I calibrated the meter by putting known loads on it and noting the varactor tuning voltage. Fortunately, there was little interaction between R and X.

I determined that the impedance of a 130 foot wire (#14) at a height of 55 feet, fed from the end is 2500 ohms on 80 meters and 900 ohms on 40 meters. (The tower w/tribander is the counterpoise in this case.) If you trim the length to center it in the 80 meter CW band (3525), it resonates up around 7500 on 40, requiring a series or shunt capacitor to pull it down to 7100. I built a tower mounted transmatch based on this info and it worked the first time!
I was also able to crank the tower up and down and observe that there was very little change in impedance above 25 feet.

Wow, there's a subject I haven't thought about for a long time. For those of you who don't know what a Nuvistor is, it's a tiny vacuum tube which was the last gasp of thermionic technology in the fight with semiconductors for the general-purpose amplifier market. Nuvistors came in tiny little stainless-steel cans delibrately designed to look like transistors.

There's a small bag of them in my dad's workshop, unless he threw them away. I'll see if they're still there. What are you planning to do with them?

938. Strange sweeping signal at 158.04 Mhz

Newsgroup: rec.ham-radio
Date: 1990-09-06 17:42:21 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <9009061742.AA16711@decpa.pa.dec.com>
Source record: 8807

Hi there. Last night I was playing with the R7000 in my home in NJ and came upon a very strong (signal strength 9) signal at appx. 158.04 Mhz. It sounded like an unmodulated carrier, but the ODD thing was that it was sweeping from about 158.01 to 158.06 Mhz approximately every 10 seconds. This was around 12 midnight. This morning the signal was gone.

I checked around the house - unplugging things - and the source was not there. I also double checked it on a Bearcat BC205 handheld scanner and the signal was there too.

Very strange. Whatever it was, it seemed VERY close. The time of day made me think it might be some sort of wireless security system, but the sweeping action makes no sense to me.

Any ideas?

Lou

939. Astron Power Supply/MFJ Antenna Tuner

Newsgroup: rec.ham-radio
Date: 1990-09-06 18:06:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9009061705.AA13389@ucsd.edu>
Source record: 8805

A few comments here ... tied-in with the "why'd my Astron Power Supply shut-down" `thread' (perhaps more properly this should be considered a `detour' titled "why you might have too much RF in your shack").

One of the guys, who responded to the "why'd my Astron PS quit?" `thread', made mention of his having been fiddling with his MFJ tuner when his Astron PS shut-down (his PS recovered when he cycled it `off-on').

A few months ago I was shocked (!) to realize that my little MFJ antenna tuner (I think it's a 941C ... it's about 8 or 9 years old) HAS NO RF INSULATION between the `hot' tuning capacitor shafts and the plastic knobs on the front of the tuner.

The plastic knobs ARE THE INSULATORS!

I noticed this after observing that, while `tuning' my balanced-fed dipole on 24 MHz, the reflected power (on my nice old Drake power meter) changed a bit, when I touched the MFJ's knobs, as opposed to the meter reading when my hand was away from the tuner. I pulled the MFJ tuner's top off and, "hmmm ... where's the insulators?".

It seems reasonable that, when that sort of situation exists, it's likely that the RF level in the shack might momentarily rise when your hands can act as a local radiator, perhaps enough to `trigger' an unexpected shut-down of an overly RF-sensitive power supply?

In article <141793@sun.Eng.Sun.COM>, Jonathan Neher, N6XUI, was asking what the
6m was
all about.

The ARRL has published a band plan for 6m, and it's printed in the ARRL Repeater
Directory.
However, I've paraphrased it below for your convenience. You should double check
the FCC
Rule Book and other amateur publications to ensure you're operating legally.

51.700 National Packet calling frequency

73,
Bayard, N1HO, who will be /1 from FN45, Pittsburg, NH on 6, 2 and 432

Thank you for publishing this... I've been looking for any info on a 6m
packet frequency and this is the first I've found. Now to order the
crystals and get on the air.

Anyone else interested? Packet seems an ideal way to experiment with
6m. It'll never miss an opening and I (the lazy operator) don't have
to constantly monitor the radio.

943. Tune up for Hustler 2M Collinear antenna

Newsgroup: rec.ham-radio
Date: 1990-09-06 18:25:16 UTC
From: U009@cs.cciw.ca
Message-ID: <5A09060F11170136-MTACY830*U009@cs.cciw.ca>
Source record: 8802

I recently bought a used Hustler CGT-144 collinear antenna for 2 Metres and
of course, it doesnt have tuneup instructions.
This antenna seems to be a 1/2 wave whip atop a phasing section (and possibly
radiator) about 1/4 wave long, all atop a shortened 1/4 wave element.
How do I tune it up? There are length adjustments on the bottom and top of the
phasing section and an adjustment at the very bottom. If someone who has one
of these beasts could paraphrase the instructions for minimum SWR, max smoke,
I would appreciate it.

And yes, I drilled the hood and put a large Hustler 3 bolt mount there. (
('77 Rabbit, so I guess I didn't hurt the re-sale value too much :-))

I haven't received much in the way of digests lately, so maybe you better
email me direct and I'll post to the net if anyone else asks.

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),
National Water Research Institute,
Burlington, Ontario, Canada.

The future lies ahead. And behind us lies, lies... lies.

>This was around 12 midnight. This morning the signal was gone.

Ultrasonic bug and rodent repellers tend to have spurious emissions in this area. The sweep rate tracks the sweep knob on the unit. They can be quieted by putting RF bypass caps (.01 uf) across the power supply jack and across the speaker (transducer). Their effective range is 500-1000 feet, so the unit should be close by.

Responding to an old thread -- I'm just catching up on back traffic:

Referring to spectrum space, you mention:
> If a valuable limited commodity were not given to you for FREE (how do
> you like that word now?), it could help reduce my phone bill, hence I'm
> paying for your hobby through my phone bill.

In this you are stating that hams have been "given" spectrum space. I take an opposite view, and I am not a licensed ham, and never have been, so therefore could be considered to have a more objective viewpoint than a ham might. Who "owned" the spectrum in the first place? This is essentially the same as the question of ownership of any non-manufactured resource, such as land, ore, fish in the sea, etc. The actual truth is that whoever seized it first, and could enforce the holding of that resource, "owns" it. When someone or something with greater power comes along and takes it, there is a new "owner".

Given that viewpoint, I say that hams (speaking here in the broad generic sense of radio hobbyists and experimenters and scientists in the late 19th and early 20th century, not narrowly of the licensed amateur) actually were the first owners of the spectrum. Their efforts made it available. When technology made it more accessible, governments imposed themselves upon the scene and seized control of this resource. So your argument is false -- it's not that the hams have been "given" anything; it's that the vast majority of what they had was taken from them, by force (since everything governments do is by force, in reality), leaving them only a few crumbs as a token.

And, as a secondary point, since the subject of this discussion was "Costs": One of the primary reasons that amateur radio is valuable as an emergency communications resource is that the purchase, maintenance, and upkeep of the equipment and the training/time of the operators is free to the general public. It isn't necessary for tax dollars to be expended to buy and maintain the radios -- the hams do it themselves out of their own pockets. It isn't necessary to employ the operators, pay for their training and pay them for their time -- they do it themselves for no recompense. This same point came up on this list some years back in a discussion of disaster-relief efforts in third-world countries. In many cases, when catastrophes struck in such lands, and the emergency-relief supplies that were supposed to be in warehouses stored up for such an event were sought, it turned out that they were simply not there. The funds for their acquisition had been skimmed by corruption, or donated/bought materiel had been stolen and sold on the black market. If emergency communications had depended on such resources, there would have been nothing there to use. Ham radio equipment and operators,

provided at no cost to the affected country and coming in from outside after the disaster occurred, provided more support than would have been possible if an "official" indigenous communications system were relied upon. While that is an extreme example, the "tax revolt" and budget crises in state & local governments here certainly limit the amount that can be spent for emergency communications that may never be used. Having free ham support appear in times of need is a most valuable contribution.

Paul Flaherty:

> >On a similar thread (since sci.engr isn't here yet): Who is responsible for
> >keeping the brain damaged English units as the primary measurement system
> >in the US? NIST? Congress?

And from Phil:

> We have met the enemy, and he is us.

And "us" includes us amateur radio operators.

I was lucky enough to be schooled during the time when the metric system
was being pushed in the USA. Then my science/math/engineering education
used it even more - slugs and feet became things to be converted to
metric before doing calculations - maybe that makes me communist or something
I don't know.

Anyway, I started pursuing my ham ticket and lo and behold,
there for all the world to see in our training literature (and in the
Handbook and who knows where else) was the formula for the length of
a half-wave dipole antenna:

(1) l = 9827397.23847 / f

where the length is in feet or inches or something - please excuse the
made-up constant. And this formula usually comes *after* we know how
to talk about 2-meters and 146MHz as the same band. We're already using
wavelengths in meters so why suggest people memorize brain-dead useless
formulas and constants? Instead, we could present the formulas in
the metric system and provide units conversions for folks who don't
happen to have metric measuring tapes - conversion being a skill they
could use in other walks of life.

So quick... what's the length of a half-wave dipole for 2 meters? Well
naturally, it's 1 meter - half of 2 meters! No formula required. A
2m quarter-wave is then 1/2 meter long which is about 19.7 inches - not
bad for no formula.

For closer results, like for 2 meters where small errors in antenna
lengths are significant, the formula to remember is still simple

(2) l = c / f

which says that the wavelength is equal to the speed of light divided by
the frequency. That 'c' value, the speed of light, is a useful
number - much more so than the one presented in (1) above. You can
use it to determine round-trip propagation time in EME or satellite

communication - or estimate the wavelength of a frequency which falls outside the HAM bands - like 11m for CB.

>How about a pointer to one of these less than $100 8051 simulators!

I don't know about that ... I have a commercial one called "avsim" and it's excellent.

However, I've got a PD cross-assembler for the 8051 family, that I would be willing to E-MAIL to anybody who wants it - it originally came from UseNet. 8051 applications are typically simple enough that a full simulator is not truly necessary, as long as you've got a little assembly experience.

Once again, let me stress that you can get an 8051 controller up for the $20-30 range (a fairly minimal system, true, but a fully functioning one). It is VERY well suited for ham radio projects -- I am always looking for good ideas !! If anybody can think of a worthwhile project, let's kick it around a little.

> to local hams that might wish to volunteer their services.

MARS is not a funny kind of ham radio named after a candy bar. Each service has its own program (coordinated at the top by a Joint MARS Chief Committee).

A ham may join the program of his choice, but it not as simple as learning the time and frequency and showing up with a cheery "I'm here!" You join by filing applications with the State MARS Director for your state. If and when you are accepted, you are assigned to a training net. Once training is completed, you will be assigned to one or more administrative nets and one or more traffic nets. Except for Navy MARS and ships at sea and for phone patching nets (both of which are tightly restricted), CONUS affiliate memebers are almost never permitted to exchange trafffic with stations outside CONUS. Even contact between the services is rare.

The training is primarily in handling traffic using the official NATO format and procedures, both of which are considerably different from ARRL NTS procedures.

MARS activity can be a satisfying, but there are two things to keep in mind: <1> it is NOT a hobby activity; it's a MILITARY program to meet military goals; <2> they want it done THEIR way and hams who join up with the attitude "I'll do you a favor and show you how it ought to be done" will find themselves invited to leave.

You were using the permeability with respect to vaccum rather than the permeability. You need to multiply by the permeability of vacuum, which is 4pi x 10**-7 Henrys/meter, or since you are using centimeter units, 4pi x 10**-9 Henrys/cm. This gives an inductance of about 535 microhenries for the inductor you specified.

>Can anyone tell me if simple frequency inversion scrambling
>is in much use (if any) at all on HF and up?

Ahhhh...well, yes, if you tune up ANY AM signal SSB and land on the wrong side-band, that's frequency inversion scrambling. Or just try copying a LSB signal in USB mode, or vice-reversa. "It's all the same."

No one with any serious interest in information security uses "simple frequency inversion scrambling", for the above reason. Lousy security. Cheap telephone scramblers do this, and descrambling may be too much for the kids down the street (MAY be!), but it won't keep anyone out who's at all seriously interested in penetrating your communications.

BTW, scrambling and cryptography are big no-no's on our bands. There are lots of private individuals and firms who have considerable (legitimate) interest in establishing private channels by such means, but Uncle Fox decided long ago that hams don't fall in this category.

If you're interested in further info on this, try sci.crypt. Scramblers aren't the big thing there, but you're likely to find some folks who know quit a lot about them.

With an edger or a turf cutter (as used at turf farms). Actually almost any
tool that will cut a narrow slit will work. Poke the wire down into the slit,
tamp, and sprinkle.

Try making a slit in the turf. I have heard of various tools being used for this, including an ax. I understand that it is best to use INSULATED wires for buried radials. The idea is not to have a good ground connection, but to make an efficient ground plane, with as little ground losses as possible. That is why it is probably best to mount the vertical up a little bit, with sloping above-ground radials (if you can get away with it).

Control BASIC and Commodore BASIC are similar only in their syntax.
The controller BASIC that I have used only allows static variables
so garbage collection is never an issue. The language is optimized
for interrupt servicing and bit level control. It shouldn't be called
BASIC I guess, but the syntax is similar. It is easy to debug without
an ICE, and the tokenized program is very small. You could write
slightly better code directly in assembler, of course, but it would
take much longer and debugging would require an ICE. It also only
supports integer math, but for the majority of control applications
this is a plus not a minus. I have used this to develop a one of a
kind machine controller for a garment plant. Since it was a retrofit
to an existing machine and quite a bit of experimentation was required
to make it work the way the customer wanted, it was a huge advantage
to be able to make changes in real time on the factory floor and
debug problems as they came up. If I had used a controller programmable
only in assembler, it would probably have exhausted both my and my customer's
patience before we got the machine doing exactly what he wanted. This

SBC from Octagon Systems allows you to develop code in RAM from a terminal, and then with a single command, burn the code into on board ROM.
In this application the SBC was able to service three separate interrupts with an aggregate frequency of 200 interrupts per second and drive sixteen solenoids while maintaining a 19.2 kb link with the terminal. This kind of performance should be good enough for all but the most demanding control applications. I'm not saying that it's better than programming in assembler from a raw performance standpoint, but it is certainly "good enough" and short development cycles count for a lot out in the field. You do have to develop a new coding style to get this level of performance though, nice clean modular code is out the window, subroutine calls cost too much in this enviornment. You tend to use interrupt service as much as possible with global flags used to communicate with the main line code running in a polled loop.

>Bruce Thompson, WB0QWS asks: "...does anyone have an easy way of putting
>radials under the lawn (without a shovel)?

I always use a hatchet (or "axe", if you prefer) to carve a little trench out. It's not that much work, especially compared to ditch-digging!!!

One trick that my friend AA2AY told me is to lay the wires along the grass in the fall (when lawn mowing is over) or spring (before it begins), pulled taught with a stake at each end (railroad ties would work; grounding rods would probably be better, but could get expensive if you've got a complicated installation). When the grass thickens and grows back, it should cover it up.

Right now, I'm installing a more reasonable ground system into a house that is wired like a grape vine. I "obtained" some belden 1/2" flat grounding strap. I was nervous about putting the Radio Shack model grounding rod (hey, they're convenient) too close to the house, so I picked a spot, but it's only about 2 feet away from the foundation. (We have a full basement). Does anybody know how well this grounding strap holds up? Is it safe to bury it?

Finally: the soil is reasonably moist, and not particularly sandy, from what I can tell so far. Should I bother with some sort of electrolyte, and if so, anybody got a good recipe?

The AT-1 was Heath's first amateur transmitter (someone correct me
if I'm wrong). I have a story about the AT-1..it goes like this:

When I was 12 years old I worked in the supply store at my local elementary
school, I was also a coin collector. One day someone purchased an eraser
using a 1931S penny. I swapped the penny out and took it home. Much to
my astonishment the penny was worth $30.00! A ham friend of mine traded
a Heath AT-1 transmitter to me for that 1931S penny. It became my first
ham transmitter. I worked 35 states on CW on 7.180 (different band plan)
using that little AT-1. The AT-1 is a simple and reliable little transmitter
and represents what ham radio used to be. Mine had the 6L6 replaced with
a more modern 2E26 although the 6L6 is still available.

The AT-1 is a classic. Enjoy it!

Yup, the stuff really works. I did the same with a 5 watt audio amp
as the transmitter and a phono premap as the receiver when I was in high
school. We even hooked up a CPO to the transmitter stakes and went to
a pair of high impedance headphones. The best we got was across the
back yard but that was because we had to stay connected to the AC lines
for the power source.

Good Idea for Cub Scout level activity, I think this is just what the
doctor ordered.

>73,
>Jeff WD6CQV/KH6 AFA8JM/AFF8A/AFF8P

Simple. Because the press cannot cover ANY topic without a very high chance of messing up on their facts. It was pretty sad to see how badly the press messed up when reporting 'facts' having to do with the Daisy/Cadnetix chapter 11 filings and so forth. Actually, having been involved in other issues (some of which the press is actively biased against), I was not too surprised to see how careless they were. Contrary to popular opinion, the press is not there to supply you with facts. Their first goal is to continue in business. Their second goal? Who knows! (And I bet that discussing it will devolve into quite a flame war, too.) (Notice that I did not say anything about 'profit', only about the survival of the business.)

In an attempt to forstall (forestall?) flames, when I say 'they' above, I do not mean to imply anything about any single member of the press.

Most all disclaimers should be applied to the above, also :-)

975. Green stamps vs. IRCs for DX QSLs?

Newsgroup: rec.ham-radio
Date: 1990-09-07 16:27:59 UTC
From: mbutts@mentor.com
Message-ID: <1990Sep7.162759.4420@mentor.com>
Source record: 8819

I've been having a great time working DX on OSCAR-13. I'm up to 27 countries worked since May, including China, Peru, USSR, etc., and while I've been licensed for many years, it's my first real DXing. Now it's time to get some of these QSOs confirmed!

When I QSL direct to rare DX, I include a self-addressed envelope, and one or two IRCs. I know many hams would prefer to get a "green stamp" (1 US dollar), as it would go farther, maybe to air mail or whatever, but I also know some countries don't permit their people to possess foreign currency and I certainly don't want to get anybody in trouble. Also there is the increased risk of theft. So I know one must be conscious of this, but I don't have a clear idea of exactly which countries should get IRCs only, and which ones are OK for $$. I hoped the Int'l Callbook would have some guidance, but no luck.

I'd appreciate hearing some specific advice on this subject, either by email or posting. Thanks and good DX to you.

I am looking for a Ham Radio Operators Club or Organization
within the city of Chicago to help me identify the source of
some RF interference I am receiving in my home Public Address
System. The source of the interference is strictly Pakistani sounding
cab drivers and I have seen many with huge antennas and been told that
they often run illegal power boosters.

Have any of you Chicago Ham Ops heard this?
Do you know what frequencies they are using?
Can they do this with 'legal' equipment?
Is there anything a Ham Operator can do to help me and the FCC
confiscate these pirate's gear?
Anybody speak Pakistani?

Thanks in advance.

A ham magazine (probably QST) published a short article about a
"ground-radial plow" in the '60s or '70s. It's a steel blade, perhaps
3/8 - 1/2" thick, 3" wide, 2' long, sharpened on one edge. It's
attached to the back end of a large garden-tractor (preferably one
with a low gear range). I've never tried it; it would probably be
most convenient if made retractable. Watch out for underground
utility wires/pipes!

I originally learned Morse in the Navy, more years ago than I want to think about..

To graduate, we had to be able to receive and send at 20 wpm. On a typewriter. My fingers were taught to recognize the sounds. Most of the time I don't really have to think about it. (After listening to code for 2-3 hours a day for a number of weeks, some of us were sending code in our sleep)

I'm no longer that fast, but using Super Morse, I can copy fairly reliably at about 13 wpm with the computer keyboard. Unfortunately I am nowhere near being able to copy by hand at 13 wpm for General.

Nowhere can I find any rule that explictly requires that the code test be taken by hand, but I have been made to understand that bringing anything to the test but paper, pencil and maybe a calculator is forbidden.

Is there a rule, or is this just something became THE WAY IT IS DONE? I can understand that typewriters used to be big and noisy, but most of the new electronic typewriters are small and relatively quiet. Now if I could convince the VE's to allow a typewriter, I could be going for my General in October instead of Technician.

Anyway, thanks for letting me ramble on..

```
##################################################################
# #
# PRE-1941 COMMUNICATIONS RECIEVERS WANTED #
# #
##################################################################
```

I'm a collector interested in buying communications receivers, literature pertaining to, and accessories for communications receivers made before world war II.

I'm particularly interested in ANY receiver made by PATTERSON, BRETTING, SCOTT, McMURDO SILVER and some receivers made by HALLICRAFTERS, NATIONAL, HOWARD and HAMMERLUND.

Tony Peterson acp@sc.msc.umn.edu (612) 422-8889 (612) 626-0286

989. Re: Antenna gain figures for QST

Newsgroup: rec.ham-radio
Date: 1990-09-07 20:34:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500722@ux1.cso.uiuc.edu>
Source record: 8688

The specification for antenna models should specify the format of the file that is submitted, and that file format should be in the public domains so such a requirement does not end up becoming a requirement to use any particular program. The requirement should only specify, or refer to a published specification, of how the antenna model itself is formatted so that ARRL or anyone else (if the model is released to the public) can study it using the tools of their choice.

If NEC and/or MININEC are good programs (and having never used them I do not know) then they can stand on their own w/o ARRL mandating their use.

The ideal program is one that is well documented, runs on all major system types, has source available, and is free. Ideal programs are rare so we have to live with less than ideal programs at times.

Ham plates end up having various usefulnesses regardless of what the original intent was, including:

1. Identify the car as likely having communications equipment and a skilled operator who knows how to use them. A police office in a situation where he needs communication capability, and knows what a ham plate means, could go to that car. He could also look for antennas and maybe get a CB-er.

2. Identify you as "one of the fraternity" to other hams, who might end up honking "hi" or your call at on the horn, or call you on 146.52 if equipped for 2 meters.

3. Make you look "normal" in hamfest parking lots.

4. Make people ask questions in which can get to say "It's ham radio...
...would you like to know what hams do these days?".

5. A way to make it a lot easier for you to remember your license plate number.

Except at hamfests, most thieves probably don't know the ham plates mean "open here for free radios" but the antennas usually do a good job of this (and magmounts can be taken down and hidden). Thieves at hamfests probably know that there is just as much chance of a radio in a car with or without the ham plates.

>As an aside, does anyone have an easy way of putting radials under
>the lawn (without a shovel)?
>
>Bruce Thompson
>WB0QWS

I used a utility knife. I took a piece of tank coil stock (the hollow kind) and bent it to feed #25 enameled copper beside the knife blade into the ground. I then wrapped electrical tape around the handle of the utility knife and the tube.

With one stroke, you cut the sod about 1.5", and the tube feeds the wire into the ground. I laid over 20 radials this way one morning. It helps if the ground is damp. What you're really after is for the grass roots to grow over the wire so you don't hit it with a lawn mower or dethatcher.

By the time you divide your power by 30-50 radials, #25 wire is JUST FINE. Also, the length doesn't seem very important, because the earth detunes the wires laid in it. (ever wonder why the FCC specifies .4 wavelength radials for commercial stations ? It's non-resonant ! It apparently doesn't matter.)

Most of the antenna current happens close to the base of the antenna, so extremely long radials are a waste. For this reason, "more and shorter" is better than "few and longer". Resonant radials are only needed in above-ground installations. Being a hypocrite, though, I laid one 30' radial just because the lawn dimensions allowed it.

NICAD CELL CHARACTERISTICS

by

Hugh W6WTU

The operating characteristics of a Nicad cell are very basic in nature. During charge, only current and cell temperature are critical. Discharge may occur at any current rate until the cell terminal voltage falls below 1.1 volts, but the cell temperature rise must not cause the cell electrolyte to boil (gas). When connected in a pack, the pack must be unloaded when the individual cell voltage falls to 1.1 volts to prevent reverse charging of the lowest voltage cell in the pack.

Few applications discharge cells at an excessive high rate where gassing becomes a problem, with the exception of toy electric cars (These are toys for men). Cells designed for this application usually have larger than average plate area and large connecting tabs to support the higher peak current. Cell temperature is kept below the critical value by selecting the cell capacity such that the cell will dissipate its charge before gassing occurs. In essence, the toy car runs continuously with a nearly zero series load resistance allowing the cell temperature to rise near critical just as cell discharge is reached.

The following brief notes will further amplify an understanding of Nicad cell characteristics.

1. Nicads are very easily damaged due to gas pressure caused by over-charging at high charge rates. Unfortunately, Nicads do not have a positive indicator for indicating the state of charge. It is up to the user to estimate the relative charge state. Typically, the charge rate is calculated at C/10 where C equals cell capacity and the 10 represents hours for charging. At C/10, a nominal or normal charge would occur. A fast charge can be accomplished, cell design permitting, by changing the ratio, i.e., 5C/2.

2. Cell temperature does rise at the completion of the charge cycle, particularily at high charge current values, and can be used as a charge completion indicator. At the moment of temperature rise, the charge

current must be reduced immediately to prevent excessive gas pressure build-up. Some chargers monitor the cell temperature and reduce the charge current to a small sustaining value. For 500ma cells, the sustaining value is typically between 10-25ma, or just enough current to compensate for the chemical change (internal current leakage).

3. Pulse charging of Nicads is most preferred as it is more efficient than a steady-state current value. Steady state current creates gas bubble formation on the plates of the cell, while pulse current tends to create fewer gas bubbles allowing the charge to be more uniform across the plate area. The charge uniformity is enabled by gas bubbles being moved around due to current pulsations. Bubble movement allows more plate area to be exposed during charge. Pulse charging also creates less of a temperature rise. The charge rate still has to be calculated as a function of C/10 during each charge pulse to determine total charge time (The accumulated charge is equal to the sum of the charge area under the pulse curve).

4. Older Nicad cells would not accept high charge rates above C/10 and would develop electrolyte seal leakage at attempted higher charge rates. A leaky seal, in any case, means the eventual loss of the cell. Newer cells, as used in most handheld radio applications seem to tolerate high charge rates without developing cell leakage as long as the temperature is controlled (kept low).

5. In the event corrosion around the seal of a cell develops, the corrosion can be removed. Wipe the corroded area with a vinegar soaked cotton swab. Use an ample amount of liquid and dry the cell with a tissue. Keeping the cell clean allows it to be used until it fails completely. Take note that weeping cells can cause corrosion problems if they are not inspected and cleaned regularly.

6. Discharge of a Nicad is critical only if the cell is under a load. When loaded, the cell voltage should not be allowed to drop below 1.1 volts which is just over the edge of the discharge end of the curve. Allowing the cell to drop to 1.0 volt or less while under load may cause permanent plate/electrolyte damage. The result would be a loss of cell capacity. Of course, a loss also takes place naturally with age which limits the number of charge-discharge cycles the cell is capable of supporting before it is exhausted.

7. Unloaded cells may be stored almost indefinately and allowed to discharge to whatever cell terminal voltage the cell can maintain on its own. When putting a previously stored cell into use, charge the cell, at least the first cycle, at C/10 for 12-14 hours. Shelf life of a cell is usually a function of how fast nickel whiskers develop internally that can short the cell. Two methods have been proposed as a way of extending cell life when whisker formation is of concern. a) Cycle the use of the cell/pack periodically. It is believed that the rate of whisker formation is reduced when cells are charged and discharged periodically. b) Allow the cell to sit on the shelf as long as needed and if a whisker short should occur, blast it away with a high current pulse from a capacitor or other source. It has been observed that once whisker growth/shorting

begins, it can not be permanently stopped.

8. It has been observed that the terminal voltage across a charged Nicad cell will increase as the cell ages. Using this observation, the life expectancy of a cell can be evaluated and monitored. As an example, a new/fresh cell will exhibit a terminal voltage of 1.25 volts while an old cell will exhibit, say, 1.5 volts. It is believed that the cell dehydrates with age and the rising voltage is a function of the increase in cell impedance.

9. Over the years, there has been many a discussion about Nicad cell memory. Yes, Nicads do have a memory function which can be aggravating if not understood. Simply stated, if the cell is used only over a small portion of its total capacity for at least 60% of the cycle time, the cell capacity will assume the more limited capacity value. To avoid the tendency of a memory condition inhibiting use, allow the cell/pack to be fully charged and discharged at least 60% of the total charge-discharge cycles. If in doubt about what is a full charge or what the discharge condition happens to be, then allow the cell/pack to fully discharge, unloaded when below 1.1 volts/cell, about one out of ten cycles. The charge rate from full discharge should be C/10 for 12-14 hours to cause as much chemical conversion to occur as possible. Charging at twice that value is not a problem as long as the cell doesn't start out-gassing (Monitor the temperature and taper off the end charge rate).

Many hints and kinks have been published regarding the nature and care of Nicads and all point to the fact that Nicads require user TLC to obtain long cell life. The bottom line is that the user must pay attention to how the cell is being treated.

Dreading the thought of burying radials, I went searching for material
to build a ground screen for my 20/15/10 meter trap vertical antenna.
Wire mesh cost more money than I wanted to spend, so I found a big
piece of scrap sheet aluminum in my barn and put it at the base of my
antenna. It is an irregularly shaped sheet, about 4 by 5 feet.
A few cinderblocks weigh it down so the wind doesn't blow it away.

I made use of some heavy wire to connect the sheet metal to my ground
rod and antenna mounting bracket.

Lacking quantitative measurements, I'm pleased with the setup.
Originally, my vertical had no radials or ground screen, and I did
notice an improvement after installing the sheet metal.

This was supposed to be a "temporary" installation, just to "get through
the winter," but it's worked fine for 2-1/2 years.

I suspect the ground conductivity is pretty good here during spring
and fall due to lots of moisture in the rich soil.

995. Kenwood R-5000 vs TS-440s

Newsgroup: rec.ham-radio
Date: 1990-09-08 01:54:43 UTC
From: Jeepster@cup.portal.com
Message-ID: <33642@cup.portal.com>
Source record: 8705

This has been driving me batty for months...

A few months ago I traded in my Kenwood R-5000 receiver for a TS-440s transceiver. Once I connected it up to my antenna, I noticed that it was showing about 2 S-units less than the R-5000 had.

Is there a way to tweak the meter on the TS-440? I hate giving RST reports of 509 and 519 when it is obvious that though the signal is somewhat weak, it is still coming in good.

73, John/KB0HBX

MONDAY SEPTEMBER 10, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* TITAN ACCIDENT *
==================
A fatal accident occurred on Friday at Edwards Air Force Base in California
when a Titan-4 booster rocket fell on its side and its bottom section
ignited while it was being moved. The latest news report indicated that
one worker is missing and another was injured in the accident.

Edwards Air Force Base is the primary landing site for U.S. Space Shuttle
missions.

* SHUTTLE TROUBLE *
===================
A hydrogen leak with Columbiae has forced a delay in the launch of STS-35.
Assuming the problem can corrected with minimal difficulty, the earliest
launch date will be around September 17th.

And if NASA didn't have enough trouble with technical problems, there have
been reports linking the operation of solid rocket motors, like those used
during Shuttle launches, with destruction of the Earth's ozone layer.

* OSCAR-17 NEWS *
=================
Here is a message recently received from DOVE-1:

DOVE-1>BRAMST <UI>:
Greetings to the delegates to the AIAA/USU small satellite
conference from AMSAT. The DOVE spacecraft is transmitting
3 plus watts. DOVE will be reset soon for software
uploading. 73 de BM.

* MAGELLAN UPDATE *
===================
So far, there has been no explanation for the periods of signal loss

experienced during recent radar mapping of the surface of Venus.
Mapping is expected to re-commence shortly.

* OSCAR-11 NEWS *
==========
Has OSCAR-11's Digitalker got laryngitis? It has been silent for several months now, and telemetry analysis shows that the Digitalker is now drawing much less current from the spacecraft's +5v power bus than it has in the past. Here are a few samples of Digitalker current before and after the silence:

03-Mar-90 at 14:30:25 UTC - 16.51 mA
31-Mar-90 at 01:03:34 UTC - 27.17 mA
08-Apr-90 at 14:20:50 UTC - 12.09 mA
19-Aug-90 at 14:44:07 UTC - 0.91 mA
01-Sep-90 at 14:00:26 UTC - 0.91 mA

At the present time, Digitalker periods are silent. The OBC status messages as well telemetry channel 62 indicate the Digitalker is indeed turned on. Has anyone got any explanations?

* SpaceNews NEWS *

When I worked as a landscaper, we used a linoleum knife (one of the ones that is curved at the tip) for cutting sod to fit. You could use one to cut a 1-2 inch deep slit in the turf, then push the wire into the slit.

1000. marine/aviation/2m ham HT

Newsgroup: rec.ham-radio
Date: 1990-09-08 06:05:37 UTC
From: rah@public.BTR.COM
Message-ID: <370@public.BTR.COM>
Source record: 8708

Getting closer to 5wpm and closer to purchasing a rig...

I am a private pilot SEL, and a (still) aspiring ham. I can justify the cost of a 2m HT MUCH more easily if it would also provide me with emergency communications while in the plane.

I've scanned the mods collections and can't find anything that would give both TX and RD from 108MHz -> 2m ham. I've heard rumors that Sony makes a special order rig, and that some company named AOL (?) also has a 2m/ aviation HT. Alas, I've been unable to run any of this to ground, so I'll make my appeal to the net. Are their any aviating Elmers out there?

Thank you!

-Rick-

I am putting the finishing touches on a basic program written for the c128 in 80 col. that manages the memory of the realistic pro-2005. I realize that the demand for such a program with this type of computer is limited, but I serves me just fine. This program has lots of room for more features, as I see them needed. If you want a copy, mail me directly as I can not keep up with this group. The program is shareware and the fee is $20 US. dollars, and as always, any monitary controbutions are accepted. Here is a list of hardware requirements:

C128, 80col, disk drive (1541,1571 -- 81, I have no idea as I doo not own one), and a printer is optional but recomended (serial only).

Anyone interested?

Tony

>
>Phil KJ6NN

Well everyone has an opinion. I test every radio I own on a routine
basis. I have never owned an Icom radio that did not handily exceed
it's specs while the single Kenwood radio I currently am enduring,
a TS790, meets neither it's power output spec (27 watts out, rated power
is 35 watts) nor it's sensitivity specs (rated .2 uV, actual .5 uV, for
12db sinad). It also runs uncomfortably hot and it's 430 Mhz power module
has had to be replaced (warranty). The new IC735 remains comfortably
cool after ten minutes key down at 109 watts into a Dielectric water
load (10 kw) on 14.313 Mhz (good test freq :-)).

My test bench has a HP608D signal generator, IFR 1200 spectrum analyser/
signal generator, Bird Mod 43 power meter, and several Dielectric dummy
loads from 200 watts to 10 kilowatts (water cooled) all specified and tested
to be flat to 500 Mhz.

Radios I have owned and tested include B&W 6100, Drake 2B, Drake TR4, Drake T4X, Drake R4C, Kenwood TS120, Icom IC745, Icom IC735, Kenwood TS790, Icom IC22A, Icom IC211A, IC451A, Icom IC402, Icom IC28H, Icom IC900, Icom IC25A, Ten Tec Argonaut, etc. This is the short list off the top of my head :-). Of them all, two stand out, the IC735 and the Drake R4C as being the best receivers I have ever used. The 735 is easier to use and is more stable, while they both are great for digging the weak ones out of the interference.

I have briefly operated a friend's TS440 and remain unimpressed. The receiver seemed only fair, the controls seemed awkward to use, and the radio got uncomfortably warm after a little RTTY work. The internal antenna tuner is of marginal usefulness with the usual random portable antenna. And who in the world needs, or can even remember what's in 100 memories?

The heatsink design on the IC735 is rather novel. First it is massive, secondly it is internal, and third it uses a squirrel cage internal blower to direct forced air over it's entire surface. It is highly effective with only a ten degree temperature rise after ten minutes key down at max power. The blower's quiet too! I stick by my opinion that it's the best radio available under $1000.

Gary KE4ZV

|> Is there a way to tweak the meter on the TS-440? I hate giving RST
|> reports of 509 and 519 when it is obvious that though the signal is somewhat
|> weak, it is still coming in good.

Never trust one of those meters! Every manufacturer calibrates them differently and they aren't very accurate regardless! Who's to say that your TS-440 isn't correct and your R-5000 is screwed up? Who's to say *theirs* is correct and *yours* is wrong!? Pick a number out of *your* calibrated ear and give it to them. S reports aren't worth fussing about. About all the meters are good for is, for a given radio, swapping antennas to determine relative differences. They can also be calibrated to determine relative power differences if you want to measure a beam pattern. Otherwise just stare at the swinging needle - watch it carefully - listen to me - "you don't care about S units" repeat "you don't care about S units".....

SB RTTYDX @ RTTYDX $RTDX0907
RTTY DX Notes 1of3 9/7/90

RTTY DX Notes for week ending 9th September 1990
BID: $RTDX0907
Part 1 of 3.

After a certain amount of percussive maintenance and calibrated
thumping, we have managed to get our machinery to act in the way that
one would expect good RTTY gear to operate. The bands this week have
been fairly slow, though it has been noticed that a certain amount of
emergency and welfare traffic is still flowing around.
Congratulations to those helping out.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JH1BLV, JH1QDB, OD5NG,
TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet
cluster. Thank you all for your assistance, and may you see some
really good DX this coming week.

RTTY DX Notes 3of3 9/7/90

RTTY DX Notes for week ending 9th September 1990
BID: $RTDX0909
Part 3 of 3.

ZK1XY is Kiyoko Yamashita, Box 3, Toukai-mura, Ibaragi 319-11, Japan.

4L9AG is at Box 6542, Perm City 614051, USSR.

Notes of Interest:

ZK1XY cards will be available on her return home.

The QSL cards for VP2V/JH4IFF should be available about mid September.
He made over 200 RTTY contacts.

JA1ACB advised that JH3DPB is now the QSL manager for 1S0XV.

JH1NQG will be signing KC6CW, and JH1BNL will sign KC6DX from
September 13th to 16th, and will sign V63AN and V63AR respectively
from Yap from September 16th to 19th . QSL to their home calls.
JH1NBD will sign S79 from the Seychelles from September 13th to 17th.
QSL to home call.

7J1ADJ will be active from Minami Torishima (JD1) starting September
14th for one week. QSL to KB1BE.

JH1QDB will sign /JD1 from Ogasawara from September 23rd to 30th.

Malpelo Island (HK0) should be active from 2 November.

Juan Fernandes will be activated by F2JD in mid November with RTTY
gear supplied by IRDXA.

South Sandwich and South Georgia are still on track for late November.

GL DE DX1 (VK2SG).

SB ALL @ RTTYDX $IRDX0990
IRDXA 9/90 Bulletin

September 1990 Bulletin
BID: $IRDX0990

The International RTTY DX Association (IRDXA) provides RTTY equipment to DXpedtions and resident amateurs willing to provide RTTY contacts from rare DXCC countries. IRDXA has no constitution, no bylaws, no officers, no members, no meetings, no dues, and no other rules. All projects are funded by donations from RTTY DXers.

IRDXA Project Status - 9/90

Thailand - RTTY is still not an authorized mode, although some contacts with HS1BV have been credited by DXCC. The IRDXA PK-232 will be active from HS1AC (science museum club station) when the mode is legal.

Solomon Is. - H44SH made more than 1200 RTTY contacts with his IRDXA equipment before being transfered. He will be active from TU soon. Late QSLS to Stuart Honeysett, c/o Serabou Seed Co. 04 B.P. 161, Abidjan 04, Cote d Ivoire, West Africa.

Tristan de Cunha - ZD9BV has worked a few on the US east coast and Europe using his IRDXA gear. Andy is getting married in September, so work him now!

Rodriguez - Hopefully 3B9FR will receive his IRDXA gear on the next boat, arriving late August. Robert is very excited!

Papau New Guinea - P29BT will receive IRDXA gear this month and should be QRV RTTY in late September.

Malpelo - Will be QRV RTTY for the 1st time in Nov. 90 with HK1LDG on the IRDXA keys. Send extra greenstamps with your QSL requests please.

S. Georgia/S. Sandwich - VP8SGI and VP8SSI will be QRV RTTY about 21 Nov. and 24 Nov. respectively, using the well traveled IRDXA Hal Telereaders. S. Sandwich is another 1st time QRV RTTY.
If you know of an opportunity to activate another DXCC country on RTTY, please call me at (213) 322-7112 or fax 213-322-7114.
Our address: IRDXA, 356 Hillcrest St, El Segundo, CA 90245 USA.

Good RTTY DX

1006. Advise needed on purchase of first HT

Newsgroup: rec.ham-radio
Date: 1990-09-08 19:38:51 UTC
From: mark@kraken.ucsd.edu
Message-ID: <12586@sdcc6.ucsd.edu>
Source record: 8714

I starting to save my pennies up and hoping to by a used HT
in the near future. Having a empty mailbox, I thought I
could fill it up by asking from some suggestions/advise.
My e-mail address is:
mark@cs.ucsd.edu

I realize that some of these questions depend upon what I
intend to use it for (which I don't know). Just assume I
got my license because I played bridge with the class
instructor.

Some random questions:

Is the choice of bands determined by anything other than
what repeater in the area seems most attractive?

What features are essential and which are marketing
fodder?

What mistakes have you made purchasing HTs that I should
avoid?

What accessories (batter chargers, etc) are (a) essential,
(b) useful, or (c) frivolous?

Since you have experience on your side, any general
rules of thumb would be appriciated.

Thanks,
mark anderson
mark@cs.ucsd.edu

I have never seen one. Something you may want to keep in mind is that even
though some 2m ham rigs will cover a portion of the aviation band, the
aviation band is AM - most HT's I've seen for 2 meters are FM.

Anyone know WHY the aviation band is AM ?

Steve

1008. Horrendous 15m QRM

Newsgroup: rec.ham-radio
Date: 1990-09-08 22:15:27 UTC
From: oo7@ut-emx
Message-ID: <37005@ut-emx>
Source record: 8716

Recently I have been hearing some very strong QRM on 15m that wipes out about 15 KHz of the band, typically 21020-030, or 21040-060. At first it sounded like ignition noise, until the person I was talking to (in Europe, both times, a couple of weeks apart) mentioned it too. It was S9 and killed the QSOs. It was there again today during the (phone) contest. It starts up around 1730 UT and goes on for several hours.

Given that it is S9, when added up over 10-20 KHz it is a *lot* of noise, and being equally strong thousands of miles away spells Big Trouble. Is it some ghastly new OTH radar system? I'd take the Woodpecker over this any day.

Anyone else heard this (you must have...), and have any idea what it is?

>for the power source.
>

I did the same thing when I was in junior high (circa 1961) to
communicate with a friend who lived about 1/3 mile away. We used
Heathkit audio power amplifiers and stepup transformers connected to
ground stakes about 200 feet apart. With a crude audio filter to
eliminate the worst of the 60/120/180 hz crap the audio tones were well
above the noise. There is a steady background of clicks and whistlers
(sweeping tones) from lighting energy coupled into the magnetosphere, so
the channel wasn't quiet. We were never able to put out enough power to
send voice in both directions (the channel seemed to work best around
3-4 khz).

But dyslexic as I am, I still never mastered CW and never got my
ham ticket (it was bad enough learning to spell and speak clearly).
Today if I was a kid playing with this, I'd probably try to send 300
baud FSK to my home computer, but back then it was only two or three years
later before I got into playing with Teletype gear and had some kind
of digital signalling device that I could use. And by that time my
friend had moved away (and gotten his ham license).

1013. Re: Ham plates in CA

Newsgroup: rec.ham-radio
Date: 1990-09-09 02:08:47 UTC
From: techie@well.sf.ca.us
Message-ID: <20181@well.sf.ca.us>
Source record: 8719

To clarify things a little bit,
From the California Vehicle Code 1989 edition.
(paraphrased)

5005 (a) one set of call letter plates may be issued to the holder of a
non-expired amateur radio license.
Plates may be issued for a car, motorcycle, or
truck (no trailers).
(c)(1) initial fee $20 (no annual fee)
(2) transfer to another vehicle $12
5020 call letter plates may be issued to the holder of a non-expired
class D citizens band license.
$20 initial fee
$15 renewal fee
$20 transfer to another vehicle
5021 only one set of plates may be issued per section 5020
4850 (a) all license plates issued by this department shall be reflectorized.
(c) a mandatory $1 fee shall be charged for reflectorized plates.
4850.1 exception to 4850: environmental plates (personalized, pearl harbor
survivor, former POW, congressional medal of honor, 84 olympics, purple heart,
or bicentennial bill of rights plates) (reflectorized plates optional)
9250 (a) registration renewal fee shall be $22 [basic fee]]
9250.8 (a) an additional fee of $1 is required [law enforcement fee]
4602 registration must be presented at time of renewal.

so, when obtaining amateur radio plates on a car you already own,
the fee would be:
$20 for the plates
$22 renewal fee (not sure if this is required if you have already renewed)
$1 reflectorized plates fee
$1 law enforcement fee
for a total of $44 (or $24 depending on if you do it at renewal time or not)

Sb: LiteBlubs-info

Recently I have heard many hams complain that they cannot find light bulbs for the control panels of their radio equipment, and have been asked directly about same. The following bulb will replace those 12-volt bulbs which seem to be too bright and fail too quickly. If the old bulb is the small (grain-of-wheat) type used in many radios, it is destined to fail soon. The 7220 bulbs I obtained from Sylvania are rated at 18 volts and last 60,000 hours at that voltage. At 14 volts, the mind boggles, and the bulb keeps on glowing (a nice soft orange...like the TM-731A set on "dim"). I just put a pair in a Kenwood 7950...much better than that goofy green color! Good luck, and happy soldering!

Jerry KD2DR

Or you could install a power resistor in series with the light bulbs to reduce voltage and increase life. If I remember rightly, bulb life follows an equasion like:

/ rated voltage \ 6
| ---------- | = times rated life
\ operating voltage /

Most likely its an harmonic from the station transmitting on 9580 kHz
at the same time.....
Just a few milliwatts of RF at 28 Mhz are capable of worldwide
coverage, especailly with a sensitive communications receiver
and a good antenna at the receiving end. It is possible that the
output of the broadcaster is within the limits regarding harmonic
radiation but I suspect it is not.

Sure - there is a toad infesting usenet by the name of Jack Schmidling
who signs his anti-semitic ravings using "Amateur Radio Foundation"
and prefaces his arguments with "ARF says:" Myself and other hams
have publicly objected to his use of the terms Amateur Radio
in association with his disgusting racism. He is, apparently, a
licensed ham. I believe that ARF is related to BARF which is
responsible for the current 14.313 mess, but I'm not sure of that.

>2m quarter-wave is then 1/2 meter long which is about 19.7 inches - not
>bad for no formula.

Not quite. At exactly 1/2-lambda, the reactance of your dipole is
not going to be zero. So, the formulae that are commonly published
aren't that useless, albeit they are in some sub-units of a furlong.

Anyway, Paul, your problem is that you think of 144 as the "2m-"
band. Think of it as the 81-inch [3^4] band (and 440 as the 27-inch
[3^3] band), and you too, can design antennae using a common household
ruler. :-)

Flat Earth forever! (No long-path to worry about :-)

>ham transmitter. I worked 35 states on CW on 7.180 (different band plan)
>using that little AT-1. The AT-1 is a simple and reliable little transmitter
I was on 7192, this was 1954. I begged and begged and got one for Christmas
that year and built it up. I was 13. I built it twice, rebuilding it after
I learned to solder properly!
>and represents what ham radio used to be. Mine had the 6L6 replaced with
>a more modern 2E26 although the 6L6 is still available.
>
>The AT-1 is a classic. Enjoy it!
>
I only have the case of mine left. I cannabalized it for parts when I didn't
know any better(sigh).

An amusing story is the "35 watts" touted for this little box. I built up
a pair of 6l6's for a plate modulator and worked lots of europeans on
10 meter AM in the summer of 1955. Then came a QST article where someone
measured the output from the AT-1 on 10 meters and it was only 5 watts!
DX with 5 watts AM and an "End Fed Zepp" antenna. Not bad. Wish someone
would give me one, I'd probably have it bronzed!

But isn't it TRADITIONAL to copy code by hand? You should learn to
write faster and ENJOY it. That's what makes a ham a good ham. :-)

Now to be serious.

Part of the problem of copying code fast is copying it onto paper fast.
We all know one can copy to paper faster by typing. If you find that
typing (be it to paper or CRT screen) is faster and better, by all means
you would use it in your station. I see no reason you cannot be tested
on this. Hopefully, if code was coming along at the speed you could
copy by hand, you would be able to do it that way.

Code tests should NOT discriminate:

1. against people who cannot print or write on paper by hand at the speed
they are trying to copy, when some other simple means is usable, such
as a typewriter, or a computer performing only that basic function.

2. against people who are deaf, but can copy code by means of visually
watching a flashing light; a means they would likely be using in a
station they would operate in code. This does not conform to the
term "copy by ear" which really should be changed to "copy by ear or
any other human sense". That would even include touch.

3. against people who have certain limited hearing impairments that
require the code be sent at a particular pitch. One can easily tune
a CW/SSB receiver to select whatever desired pitch they want (the
good ones anyway) so why not be able to tune the pitch of the code
in the exam.

I have the hearing impairment described in number 3. The local 146.76
repeater in Champaign IL uses an ID-er with a pitch in the range that I
cannot hear changes taking place. It seems to be up around 1500 hz or
so. What it sounds like to me is a tone that just slightly wavers with
amplitude. I can tell it is ID-ing by hearing that pitch. When I hear
some other sound at that pitch, it sounds like the repeater ID-ing.
When I hear that sound, I often find myself looking around for the radio
that was left on.

Be sure to understand this. I *CAN* hear at that pitch, and I can hear
very weak sounds. But the problem is that variations in amplitude are
not heard over very short periods of time at these certain pitches.
I seem to be able to hear code fine between 450 and 700 Hz.

> Nowhere can I find any rule that explictly requires that the code test
> be taken by hand, but I have been made to understand that bringing
> anything to the test but paper, pencil and maybe a calculator is
> forbidden.

Then call up all the VEC's and ask them if they allow you to copy by
ear with a typewriter or keyboard.

> Is there a rule, or is this just something became THE WAY IT IS DONE?
> I can understand that typewriters used to be big and noisy, but most of
> the new electronic typewriters are small and relatively quiet. Now if
> I could convince the VE's to allow a typewriter, I could be going for
> my General in October instead of Technician.

I've seen no such rule. There occaisionally are VE's that refuse to allow
one to do things that are perfectly legal. For instance some VE's in this
area recently refused to allow someone who was either a Novice or Tech (I
forget which) to take the 20 WPM code test. They were required to first
take the 13 WPM code test. The FCC rules specifically allow one to get a
class of license based on having passed a code test of a higher speed.
I don't know what ever came of that case, but the guy ended up not taking
any tests there.

The nominal cell voltage is something like 1.2 volts. An 11 cell pack which
gives me 13.2 volts, would give me 12.1 volts at this level of discharge.
There are packs available as low as 7.2 volts and the radio words well down
to 6 volts. So how does one know when the cell voltage is below 1.1 volts?
This is NOT an easy thing to do. The radio will still be operating when the
cell is dogn to 0.6 volts.

In fact I quesdion that this level (1.1 volts) is even correct as the point
where damage can occur. If it does, it appears to be very subtle.

STS-35/SAREX LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 251.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX Mission Delayed Due To Hydrogen Leak

NASA officials have informed AMSAT-NA SAREX personnel that the launch of STS-35 has been further delayed due to a small hydrogen leak in the aft Shuttle engine compartment. Although a smaller leak this time than the one which caused a roll-back of the Shuttle Columbia several months ago, tech-nicians found that the concentration of 6,000 parts/millon of hydrogen in the engine compartment was enough to cause concern to delay the launch and begin repair operations. All radio amateurs who have been looking forward to this exciting mission are asked to have a little more patience while these "pesky" leaks are being fixed. According to NASA officials, the earliest the Shuttle Columbia can be ready for lift-off is September 17, 1990. All SAREX operating times are based on Mission Elapse Time (MET). So regardless of the launch date, operating schedules found in past ANS bulletins and in W1AW bulletins will still hold. Amateurs will just need to recompute the time based on the new lift-off time. Likewise, all operating frequencies for the SAREX packet radio robot operations will remain the same. However, as the STS-35 launch approaches again, this pertinent information will be repeated. Please stay tuned to AMSAT HF/VHF Nets and AMSAT News Service (ANS) bulletins for further updates on the launch of STS-35. Also, W1AW will be providing updates on the launch during its daily CW and Voice bulletins.

Fuji-Oscar 20 Experiencing Temperature Problems

JAMSAT reports that since emerging from an eclipsing period in late August, FO-20 command stations have been having difficulty controlling the temperature aboard FO-20. Battery temperature had risen to over 40 deg. C when mode-JA and JD in simultaneous operation. Even after turning off both transponders last week, the temperature of the was still at 35 deg. C. If the batteries are left at these elevated temperatures for any prolonged period of time, it significantly reduces the battery life. (As a point of reference, the Microsat Battery temperatures typically hover around 0 to 5

deg. C.)

While the command station is collecting data on this problem and works on a solution, it can be expected that FO-20 will not be on any sort of regular operating schedule.

NK6K Provides Answers About Future PACSAT BBS Operations, PART I

AMSAT-NA Area Coordinator Jim White (WD0E) has asked some questions that are probably of general interest to OSCAR satellite users about the PACSATs and AMSAT software engineer, Harold Price (NK6K), has responded with the following answers.
WD0E: "Which PACSAT will commence BBS operations first?"

NK6K: "UO-14 is now about 80% functional with the BBS software. AO-16 will be brought to that level, then LO-19.

WD0E: "Will the TLM or Whole Orbit Data (WOD) format, frequency or any other parameters change?"

NK6K: "This is more of a spacecraft control than an application question. There is nothing in the new code that will require a change. WOD will probably end up as files, and be downloaded or broadcastable. This means that it won't come down in frames sent to WOD, but the internal record format will be the same. I'd like to see some compression on the WOD, but we may be running out of code space. If it is compressed, the groundstation software will know how to decompress it. We'll do a update to the Operating System runtime libraries next year that will give us back some program memory. There would be no frequency changes."

WD0E: "Will people still be able to just digipeat through the PACSATs?"

NK6K: "This has not yet decided. Digipeating is a good way to check out your station. I don't think there is much other demand for it in the long run, The MICROSATs are available now for digipeating, but you don't see much of this type of activity. I would not want to see digipeating supplant the intended use of store-and-forward data, but if there is a big demand I suspect it would be addressed."

WD0E: "How will the "user" ground software be distributed and tested?"

NK6K: "Jeff Ward (G0/K8KA) and I have discussed two approaches. However, nothing has been finalized. The first approach is to make a minimum implementation of the user ground-based software available, including C language source code, as shareware. We want to get something out soon, and, since Jeff and I are IBM PC-based, availability of code will hopefully encourage others to write for MAC, Amiga, C-64, Unix, and others. The only

downside is we don't want to leave the impression that all AMSAT offerings are shareware. The minimum implementation will not be automated, and will not be pretty (colors, windows, pulldown menus, etc.) but will be more portable. The second approach is for AMSAT-NA and AMSAT-UK make available an "all-singing-all-dancing" PACSAT groundstation program. This will be automated, easily interfaced to terrestrial BBSs, and will have a fancy menu driven format. No source."

PACSAT BBS INFO, PART II

HR AMSAT NEWS SERVICE BULLETIN 251.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

NK6K Provides Further Answers About Future PACSAT BBS Operations, PART II

WD0E: "How will WOD dumps and BBS output be interleaved on the downlink?"

NK6K: "The broadcast protocol provides for demuxing broadcast files. This is probably how WOD will be done. These frames are sent to the address QST-1. Direct connect BBS file transfer is done in frames sent to the user's address. The broadcaster controls the repetition rate for simultaneous broadcast files, based on the number of user's requesting a file, or the file's priority. The method for prioritizing broadcast vs. direct connect (FTL0) is To Be Determined."

WD0E: "How will people know the BBS is running and available? Will they be able to tell by looking with an ASCII terminal program, with TLMDC or similar or will they have to have the ground software to tell?"
NK6K: "Much ado will be made. Also, you'll see frames sent to QST-1 with a PID of BBS."

WD0E: "Will the user ground software be available before the BBS in the bird is turned on?"

NK6K: "Available, yes. Widely distributed? No. We have to have it running on the air to give it a good test, but don't want to subject it to simultaneous connects on the first day. Once a week's worth of testing by users has been successful, the shareware will be placed on Compuserve and elsewhere."

WD0E: "Will you be testing BBS and ground software together for a time prior to making ground available? How will people know that is happening?"

NK6K: "Yes, we will. This is happening as we speak on UO-14. People will learn the same way as always, via official AMSAT Nets and publications."

It is hoped that these answers from NK6K will give radio users a further understanding about the PACSAT user BBS software.

AO-13/AO-10 TRANSPONDER SKED

HR AMSAT NEWS SERVICE BULLETIN 251.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060
The September 10 attitude estimate is:
BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals started showing signs of FMing. Therefore, until further notice please DO NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

Ground loop communications - yes get the stakes as far apart as possible
at both the transmitting and receiving ends (so as to maximise the area of
soil energised). Wet soil is best. Make use of any local features (like
ponds, streams, swamps) to get a good low-impedance connection.
If you are after voice comms, consider using a power oscillator and
modulating this (try something around 60 to 80kHz) as you will get greater
range.
FM is probably best. Beware of harmonics of TV scan oscillators, switched
mode power units etc; these are horrible rasping noises!
If using a PLL detector, you may find that it locks to one of these nasty
noises instead of the intended signal.
If you use AM for the oscillator, consider using a communications receiver
that tunes down the LF end as the detector. Some ex-military
radios go down to 60KHz. Alternatively a phase-lock-loop (NE565) does a
good job with FM.
If you use raw audio rather than a carrier-based system, a receiver notch
filter to take out the local mains frequency can help. Alternatively use
a low-pass filter to slice off everything below about 300Hz.
I have got about 3/4 mile with 60-watts (TV sweep-tube) and a commercial RX.
Try using forks or shovels as the ground electrodes (they have a larger
surface area so reduce the coupling losses).
During World War 1, rifle bayonets were used as the electrodes, and
'spark' transmitters using rotary-wheel interrupters to generate the
signal.

Good point, but the price difference is not that much. $13 for the
alkaline pack, $5 for the plug, a couple more for the regulator ... I
am just going to buy the adapter. Now, if I had an old cigarrette
lighter plug, and an old regulator around, I would build one.

1031. ICOM 2AT HT mods?

Newsgroup: rec.ham-radio
Date: 1990-09-10 12:20:57 UTC
From: dls@genrad.com
Message-ID: <38675@genrad.UUCP>
Source record: 8642

Fellow Netters,

I have a friend who has an older ICOM 2AT. He claims this is different from the 02AT....Anyway, the radio does not have the capability to transmit OR receive below 144 MHz, or above 147.995 MHz. We are interested in expanding the frequency range so that it can transmit and receive on Civil Air Patrol frequencies, down to about 143 MHz and up to about 150 MHz.

Are there mods available for this radio? If so, can someone please send me a copy of these? I do not have any ftp access, just email and usenet access.

Thanks much!

>Charging of Gell-Cell batteries

...

>When charging off of a voltage regulated source, adjust the charge voltage
>to a value just higher than the full charge value of the battery.

[etc. all of which i cheerfully agree with...]

One added point: The full charge voltage is dependent on the cell temperature. I haven't the data handy, but the full charge voltage _rises_, noticably, as the temperature falls. If the battery is always at constant temperature when charged, the temperature dependence of the voltage is not a problem. If the battery is cold, undercharge, if warm potential overcharge or damage.

This is characteristic of NiCd and Lead-Acid systems, and, i believe of all rechargeable systems...

(references: GE NiCd Designers Handbook, any good discussion of lead-acid cells.)

>
>It was owned by a French company. Want to bet it'll end up being owned by a
>Japanese company?

Heath has been owned by many people throughout it's lifetime.
DAYSTROM - SHLUMBERGER - and I believe they were even independant
originally. A few years back they were bought by ZENITH. It was hoped
by us old time Heath users that that would spark new life in Heath
because of Zenith's large market for consumer electronics. Actually,
it was business as usual.
About a year ago, Zenith was bought by Honeywell-Bull. (yes it is french)
Assuming they only wanted the computer part of the company, I asked a
Zenith Rep what affect it was likely to have on Heath. He said he didn't
expect any change to the companies product line as a result of the sale.
So much for his opinion.

>
>I'd like to see Heath bought by R. L. Drake and get both back in the ham radio
>business.
>

I think this is the most likely of the possibilities. I all likelyhood
the company will change hands yet again and there will be no apparent
difference in it's operations.
Of course the other possibility is that because of the high price of
Heath's equipment compared to Japanese rigs, the company will not be
seen as competitive and therefore a bad investment, resulting in the
demise of yet another of ham radios traditions.

As an aside, I don't really understand the high cost of Heath gear today.
I doubt seriously that any of it is made on this side of the ocean
anyway.

A very spffy way to drill holes into automobile sheet metal is by using a drill bit made specificly for the job. Larson has available (for ~$21.00) a 3/4 inch bit that has pilot bit and a ridge that keeps you from punching through the headliner while removing the paint back a 1/8 inch back from the 3/4 inch hole. Very SLIC bit and well worth the cost for headliner protection when drilling for NMO style antennas. Highly recommended.

Swiss cheese-style autos forever...

I heartily agree...

> The problem here is one that I see as becoming rampant with the spread of low-
> cost computers and CAD systems. People trust their finite element CAD systems
> too much.

This is a parallel of the trust put into CAE programs. "You don't need to
measure anything anymore... just simulate it"

> Unfortunately, many schools are using the models to excess without giving
> students a firm grasp of the fundamentals and the knowledge that your model
> may not always be right.

I go further than that. The model is *always* wrong. It may be close enough
to give you acceptable performance, but it is always incomplete....

I also agree with Barry that an independent measurement is probably the
only way to get really useful numbers.
For a little while after the ARRL stopped allowing gains to be published
a few manufacturers managed to slip some beamwidth data by in their
advertisements. If one can make some asumptions about antenna efficiency this
is pretty close to a gain specification.
Measuring HF antennas pretty much requires an expensive range, either
outdoors or a very expensive one (nearfield) indoors. Qualifying a range
is no small job in itself. This whole problem speaks to the end user's
expectations too. A large yagi 10 boomlengths from the a perfectly conducting
ground is not likely to behave the same as when it is located one boomlength
above typical urban clutter and ground.

I question the value of any single number which can be applied
to an antenna to indicate its value. Since the number only makes sense
in one context (the range) and the degree of variability over all the
likely applications is so great I'm not sure that it serves to do much
more than provide fodder for late night 75 Meter arguments.

Maybe a column of testimonials is just as good...

1038. Ham software for Apple IIc?

Newsgroup: rec.ham-radio
Date: 1990-09-10 16:39:17 UTC
From: dls@genrad.com
Message-ID: <38678@genrad.UUCP>
Source record: 8649

I have a friend who is interested in obtaining some ham software for the
Apple IIc. He called me, because he wanted my software (for Macintosh)
on his computer, and I told him it's not compatible and I have no intention
of trying to make it compatible.....I don't have access to an Apple IIc.

Anyway, he's interested in a Morse code program, speed must go down to 5 wpm,
since this is for a prospective ham. Also, he's interested in any software
available for the technical written tests as well, similar to my Novice thru
Extra Ham Stacks for the Macintosh.

If any of this stuff is available, could you please email me how to obtain
these programs?

Thanks much!

By the way, just to remind everyone, the Macintosh Ham Stacks (you must already
have HyperCard) that I wrote are available to any or all who send a SASE,
plus 800K diskette:

1039. Re: Kenwood R-5000 vs TS-440s

Newsgroup: rec.ham-radio
Date: 1990-09-10 16:53:53 UTC
From: paul+@andrew.cmu.edu
Message-ID: <oauwIVy00UhB01wVlP@andrew.cmu.edu>
Source record: 8650

S-Meters do not measure signal strength. They measure the voltage or current at some point in the AGC circuit of A PARTICULAR receiver. Since no 2 AGC circuits are exactly alike (even in the same production run of a given radio), using S-Meter readings as an ABSOLUTE indication IS INSANITY. They are useful only for relative measurement (comparison purposes) only.

1040. CTCSS circuit for FT747?

Newsgroup: rec.ham-radio
Date: 1990-09-10 17:08:18 UTC
From: henryb@hpspdra.HP.COM
Message-ID: <12280016@hpspdra.HP.COM>
Source record: 8651

Hi, I want to put a CTCSS encoder in an FT747 HF transceiver to use a
29Mhz FM repeater which requires the tone. The technical manual
for the 747 apparently shows provision for such a device to be added
"FTE-10 option", but this option is not available at my local emporium,
nor is it mentioned in the operator's manual.
I'm sure I can handle this project, but why re-invent the wheel if
someone else has already designed the mod.?
So, . . anyone have a circuit?, or measured suitable signal levels for the
subaudible tone injection?, or any helpful comments?

1041. AR1000, R1 Compare

Newsgroup: rec.ham-radio
Date: 1990-09-10 17:17:13 UTC
From: stone@apple.com
Message-ID: <10127@goofy.Apple.COM>
Source record: 8652

Since I have yet to see any comparisons between the Icom R1 and the AOR
AR1000 I thought I would post my comparisons.

Comparing R1 and AR1000 only major differences hi-lited.
This mostly compares functionality.

General

AR has 1000 memories, R1 has 100 with some dedicated to
certain functions.

R1 has signal strength meter
R1 has a clock and related timer functions.
R1 allows you to adjust display contrast
R1 allows you to turn the display on/off on a button push, or
off after 10 seconds.
R1 power saver is selectable.
R1 has a receive LED that lights up when a signal is received, it
can be disabled.

R1 frequency range is 100khz - 1300mhz
AR1000 8khz - 1300 mhz, missing the TV band.

Both have a tuning knob.
R1 tuning increments are
0.5, 5, 8, 9, 10, 12.5, 15, 20, 25, 30, or 50 khz
The AR1000 is from 5 to 995 in multiples of 5 or 12.5 khz

Scanning between a lower and upper bound.

Each scanner allows you to have ten upper and lower bounds. However,
the AR1000 allows you to link them.

Both allow you to blank out frequencies in the search bounds. The
blank outs are stored in memories 79 down to 20. This will over write
whatever you had in there. The AR 1000 has this feature too, but you
get 100 blank outs (lock outs) per search bank.

The R1 has an auto-write feature that will store a frequency
when it breaks squelch. It uses memories 80-99 for this.

Scanning memory channels

R1 has a mode in which memory channels are scanned based on
the modulation of the carrier, AM, FM, NFM.

The AR1000 organizes the memories in 10 banks that allows
the scanning of any combination of banks with individual
channel lockouts with in the banks.

User Impression

The R1 looks nice and its very compact. However, the buttons are
too small. That and the weird memory organization are what I don't
like about it. The signal strength meter is very nice.

The AR1000 has very poor documentation. After talking to someone
who had an AR2002 and now has the AR1000, he has found many short-cuts and
undocumented features that make using the AR1000 simpler than would
appear. Late note, apparently the
documentation has been upgraded.

They both seem equally sensitive. I could get WWV on both of them at 10
MHZ, and I went from there through 800 MHZ.

It is true that the aviation bands were set up before nb fm was popular.

I had heard that the reason for staying with AM is that when two different
pilots are transmitting at the same time on the same channel, the tower can
sort of make out what is being said by each. This allows an emergency to
break in to another transmission. With FM, the capture effect eliminates all
but the strongest signal. The weak signal makes just a little squirmy sounding
squeal.

This letter from Terry introduces the concept of their new publication
"Communications Quarterly" -- The Journal of Communications Technology.
The journal is scheduled to premier in mid November 1990 and is geared to
the tastes of "dedicated Radio Amateurs -- those constantly looking
for technical challenges"
Terry is "looking for articles which push the technical envelope to the
limit." The editorial review board is broad in background with a lot of
former HRM authors and a couple of old HRM staffers. According to Terry,
each isue will run about 100 pages of editorial material and advertizing

part will be "strictly limited." Articles will flow from page to page without
interruption from ads. An open layout format will be used. Terry finishes
by saying that their current payment schedule is $40 per printed page with
part payment upon article acceptance and the balance upon publication. She
claims that this is actually more than the old HRM rate due to the open
format layout.

I went out to buy a FT757 or ICOM 735/725/726 and ended up getting the
TS-440 with the antenna tuner.

>
>Actually the TS-440s, IC-735, and FT757 are all in the same class in
>both performance and price.

Uh, correct me if I am wrong, but when I looked the 440 was approximately
$100 more than the 735 or 757. And thats not including the tuner. Add
another $200 to the price of the 440. I was told that the built in tuner
will not tune if swr is greater than 3:1. More or less if the antenna
is not cut for the band it wont tune it. Is this true? I lack experience
here. If this was the case then I really don't see its purpose except to
save finals on band edges. Personnally, I also like the built in tuner;
it sure beats the expensive external auto units made by yaesu and icom.
Though it will not work on 160 meters, which I don't use right now.

>make my appeal to the net. Are their any aviating Elmers out there?

Unfortunately, Rick, I don't think you'll have much luck finding mods for
typical HT's for operation in the aircraft bands. The reason being that
2m is FM, and the aircraft band is AM. I know of one _mobile_ rig that
can receive (and maybe transmit) in the AC bands, that being one of the
Azden units. Icom sells an aircraft radio with a built in VOR, but it
doesn't do 2m. Sorry I couldn't help any more that this, but that's
all you get for free :-).

Recently I obtained the all mode squelch modifications for the Kenwood TS-680S from info-hams. A friend of mine installed the modification as described and reports thatt it works fione and that he has noted no degradation of performance of the rig.

He also reported that you'd better have some experience before starting on this mod.

1053. Re: Ground communication.

Newsgroup: rec.ham-radio
Date: 1990-09-10 22:55:41 UTC
From: commgrp@silver.ucs.indiana.edu
Message-ID: <57866@iuvax.cs.indiana.edu>
Source record: 8661

(Elaborating on nice ground-communication article by Pete Lucas, G6WBJ):

Modern Electronics magazine, Sept. 1990, has an article about through-the-ground communication using a stereo amplifier and matching transformers. The author recommends using equalizers for best results.

I've done earth-dipole experiments using a 200-watt cop-car amplifier, with a 400Hz Variac (tm) for matching. ("Earth dipole" is the preferred term for ground communication; "earth current" is naturally-occurring current through the ground, associated with aurora, magnetic storms, etc.).

I once connected a pair of ground rods to an audio-frequency spectrum analyzer, to look at the 60-Hz harmonics. The strongest harmonic is 180 Hz, probably a 3-phase effect. The harmonics extend into ultrasonic frequencies, but the strongest are below 600 Hz. A high-pass filter which cuts off at 600 Hz works well for separating hum from voice. Cutting off at 600 Hz eliminates a band of voice frequencies called the First Formant; characteristics which identify individuals' voices are lost, but intelligibility remains.

Some LF/VLF experimenters have developed a microprocessor-based adaptive filter which samples the ambient 60Hz waveform and makes a replica 180 degrees out of phase. It's said to reduce hum by 50 dB.

Nathan B. Stubblefield of Murray, Kentucky, apparently discovered the inductive and earth-current communication principles. He demonstrated wireless voice transmission in 1902, long before radio was practical, using magnetic induction to communicate several hundred feet. His equipment was made of telephone components, and used no amplifiers (which were not invented until 1907). He did not profit from his inventions; numerous articles recount his tragic story.

Stubblefield also communicated to a reported range of one mile, apparently by injecting current into the earth between two widely-separated ground rods, and detecting the signal between a distant pair of similar grounds.

Perhaps Stubblefield discovered the earth-current effect during his work as a telephone repairman. Old-style telephones with internal batteries and hand-cranked ring generators (including military field-phones) can operate over a single wire, using earth for the return path. Stories from World War I tell of using ground probes to intercept enemy telephone traffic along parallel trenches, without direct wiretapping.

When warring governments suspended ham-radio activties during the 1940's, some disenfranchised hams communicated by "ground wave," using audio amplifiers to feed currents into the earth through pairs of ground rods. Ranges greater than one mile were claimed.

Stubblefield may also have discovered that the earth-dipole and induction methods interact: Alternating current through the ground creates a magnetic field detectable by coils. Conversely, an AC-carrying coil induces currents into conductive earth, which are detectable by ground probes. The well-known interaction is used in geophysical prospecting methods. Cavers who have built baseband audio communicators which use both inductive and earth-current modes report that induction works best through dry, highly resistive rock, but earth-dipole provides best communication through very conductive overburden. At one location, the soil in the bottom of a sinkhole was so conductive that magnetic signals from an underground coil were undetectable on the surface, but when the transmitter was switched from coil to probes, it became loud and clear through the surface receiver with coil antenna. British cavers report that inductive communicators sometimes do not work in caves under highly-conductive peat bogs.

An easy way to make a code-practice oscillator is to remove the earphone and carbon mike from a standard Western Electric telephone handset, wire them in series, and place them face-to-face. They form an audio-feedback oscillator which makes a very pure tone. Its frequency depends on voltage and polarity; a 9v battery works well as the power source. It may be necessary to remove the varistor or capacitor that is across the earphone's terminals.

If you make a Long Distance CPO using mike-earphone buzzers, then you can separate the elements and it becomes a telephone. (Don't tell the students that until after they learn the code. :-) Alternatively, it's an easy way to make a ringer for home-brew phones.

Sorry for posting this, but I couldn't mail direct.

For Azden PCS-3000, the CTCSS tones come from an after market tone board installed inside. How to set it depends on what board you have installed. The one from Azden (actually from amatuer wholesale or who ever sold the radio) is usually from Communications Specialists. If the installer followed instructions, there should be a label on the inside cover to show the dip switch settings. If you don't have the list, you should be able to contact the TONE BOARD manufacturer for the settings. I have the comm-spec (ss-32 I think) board in my PCS-4000. If you email me direct and I can get mail back to you, I'll send you the settings.

Let's hope so, remember that Heath in Canada was shut down only
six months ago.

They had a weird warehouse sale, all these bargins, but most of them
were to sell off the accessory kits that Heath has for their products.
So if you had some of their test equipment and wanted the add-on
for it, fine, otherwise you got a box of random parts. Of course,
the selection of stuff was limited, but they had lots of what was
there.

1062. Picking on BASIC (was Single Board Computers)

Newsgroup: rec.ham-radio
Date: 1990-09-11 13:19:37 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12621068446.13.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 8668

There was a recent message, originally about one-board computers, which lapsed into criticism of BASIC and garbage collection. Although this is a ham radio forum, many of us are BASIC programmers (or were) and some comment is appropriate.

BASIC itself does not specify a particular garbage collection process. Each individual implementation does so by some means, but the speed and efficiency varies with each interpreter. In the Commodore 64, the specific type mentioned, garbage collection occurs almost always as a result of string manipulation. Except for those defined in statements (such as PRINT "This is a constant string"), all strings are stored dynamically in the "heap". Commodore 64 BASIC saves them along with a pointer to the location. When the heap gets too full, BASIC stops interpreting, and starts through the heap, from top to bottom, checking to see whether the strings are still in use. Each string is then either discarded, or relocated higher up in memory until ALL THE HEAP has been checked. For programs like editors, this can be a large amount, and can lock the machine up for quite some time (tens of minutes). This is specific to the Commodore 64. On the Commodore 128, with a larger data memory, the process is different, and a garbage collection of the entire heap takes less than 5 seconds.

As a side note, there was a short machine language program published in either COMPUTE'S GAZETTE or RUN magazine (I can't remember just now) that "cured" the C-64's garbage collection problem, and cut the time from many,many minutes to less than 3 seconds. If anyone really needs to know, drop me a note here and I will look up the issue for you.

Thus, this longish note is just to remind everyone not to lay blame for a particular machine's characteristics on a language. As was recently noted, the controller versions of BASIC, usually limited to integer math and constant strings, can fly right along, and do make programming much easier than assembler.

Along the subject of ground pegs, I went to the local hardware/building supply store and bought a supply of really large (12") spikes, soldered or brazed the ground wires to these spikes at the ends and in the middle and drove the spikes in the ground. They keep the wire taught and also afford "some" contact with the ground. I know they are iron, you have to use muratic acid flux to get solder (use 50-50 and a propane torch) to take. Do everything you can think of to neutralize the acid before you solder on the radial wire, soak in sodiumbicarbonate solution for a while and wash with water. Yes, the spikes do oxidize somewhat when in the ground but they are a decent hold down. Now if you could get them to take a good thick copper plate. May want to try using the spikes or some other core item inside a length of soft copper water or refridgerant tubing and soldering (brazing is really better) the ground radials to the copper, drive the copper into the ground, remove the spike core and fold over and crimp the end of the copper tubing. The concept is cheep and should work quite well. For those with problem soil you could use plumbing fittings and make the copper tube into a water ram drill to get through clay. For shale, put in anything that will work, the copper is probably too soft.

Actually, the "file format" is only important to the validating
agency (ARRL/QST), the manufacturer and to anyone wishing to purchase
the disk models. The model format or model specification is the important
concept.

> such a requirement does not end up becoming a requirement to use any
> particular program. The requirement should only specify, or refer to

The requirement of a specific program is that modeling results may not
be repeatable on other programs. At the very minimum, the model algorithm
must be the same in all programs used in conjunciton with the specification.
Model execution may vary from program to program due to the various efficiencies
addressed by the program developers but the results must be the same for
identical model input specifications. It is the consistancy of the modeling
results from consistant inputs that is necessarilly the cornerstone
of the proposal.

> a published specification, of how the antenna model itself is formatted
> so that ARRL or anyone else (if the model is released to the public) can
> study it using the tools of their choice.

MININEC input format is (can be) in ascii, no need to actually have the
program to write the arrangment of wire segments, source values and phasing
and select ground type to specify the correct model for the antenna. With
an ascii description one could model the antenna to ones content. MININEC
is in the public domain and available through several sources including
the excellent archive at WSMR, SIMTEL-20. It does require BASIC to run
and is fairly large. Several parties have made more user friendly forms
of MININEC available. The concept is that the model be easily documented,
described and easily replicated. The results should be consistant and that
is the reason I have suggested a readily available program.

>
> If NEC and/or MININEC are good programs (and having never used them I do
> not know) then they can stand on their own w/o ARRL mandating their use.

The mandate is first in model description, that it be consistant and, second,
in the tool used. Quite a few institutions and organizations put a lot of
stock in NEC and MININEC (within the limitations of their performance) to
allow the selection of these modeling algorithms to be considered as standard.

>
> The ideal program is one that is well documented, runs on all major system
> types, has source available, and is free. Ideal programs are rare so we
> have to live with less than ideal programs at times.

I grant that neither of these programs may be ideal on ALL points but at least
MININEC is free, can run on most major systems (maybe not cp/m, Commodores etc.)and is
moderately documented. The publication of a "SPEC" would add
documentation and allow repeatable modeling.

A lot of us are interested in interfacing our PRO200x series scanners to our computers. Just what does your program manage? Is it a database program that keeps track of what you have programed into each of the 400 channels? Or does it actually control the memory of the scanner itself through some sort of hardware interface? I can keep track of what I have programmed into memory with dBASE or some other database manager. Computer control of entering frequencies into memory or recording active frequencies in search mode would probably interest a lot of us. How about a few more details on what your program actually does?

You'll probably get a million replies about this --

There is no reason why you can't use a typewriter or computer to take the code test, as long as it's you and not the computer that is taking down the code. In the Mass/NH area, every VE that I talked to said that their organization would be willing to test people who used typwriters as long as the applicant gave them sufficient advanced warning that they could set up a separate test area (so the keyclicking wouldn't bother the people who were trying to take the test in the more traditional way.

Hmmm...the formula that I found in some old engineering reference is:

%Life = (Rated Volts/Actual Volts)^(13.1)

Thus, the ratio is raised to the 13.1 th power...

I put this into a Lotus 123 spreadsheet and ran out a bunch of typical values... a 10% voltage reduction gives almost a 400% increase in bulb life! Conversely, a 10% overvoltage brings the life down to 30% of the manufacturer's rated value...

A good reason to find 130 VAC rated incandescent light bulbs for those sockets way up high over the stairways that are soooooo hard to get to.

Hi there from the Great White North.

A lot has been said recently concerning microcontrollers of the MCS-51 family (8751, 8031, etc).

A poster recently described his G.E. Cell Phone as being 8031 based.

So to assist the home brewers out there who want to modify their cellphones for use as I.F. strips for microwave units (my desire) or as high speed packet units, I offer some software we developed for another project: the MCS-48 and MCS-51 disassembler! The package is rudimentary, but it works fine. It is necessary to examine a dump of the binary to find non-code areas since the routine isn't smart enough to save itself if it gets mixed up (reminds me of the infamous diagnostic in the CP/M BDS C compiler: "I am totally confused.") Anyhow, a sucession of trial disassemblies and refinements of the tables will usually do a good job on the code.

Email me at my site and I'll send you a copy, (C source etc.) but be warned, it's not a commercial product and the documentation leaves a lot to be desired (like documentation).

Is G.E. the only vendor of cellphones to use the 8031? Go ahead, dismantle your new toy and let the net in on it. Enquiring minds want to know.,

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),

This raises a side of electronics that has been a quiet revolution.
It is also something that has made it as cheap to make stuff in
Switzerland as Malaya. I am going to try to be brief here so forgive
me if I miss anything.

Back in the 60s when most of my generation were taking drugs and
telling me they had learned how to "communicate" I was learning that
"electronics" was one of the most labour intensive industries. These
were the days when PC boards were coming in, but many companies like
Tektronics were still making stuff with glowfets and point to point
wiring. Building radios and stuff was a semi-skilled activity. It took
a large amount of time to build and align a Collins S line or Racal
RA-117 radio. This is what had to be paid for. Labour was a major part
of the cost of an electronic device. In these days, Heath was a deal
because the i supplied the labour and called it pleasure.

Then PC boards and ICs came in and the labour to function ratio went
to hell. To reduce labour further, automatic assembly and test
equipment came into being. So these days instead of rooms full of
women with smoking soldering irons we have halls filled with automatic
machinery stuffing multilayer boards, soldering them and testing
them. Whackity-whak and out comes an XT board that retails for $80.00.
A receiver in a chip costs $3.50.

The last product that I ever worked on getting to market was an
answering machine with combined phone and dialer. The device had 45
mins of human labour time total and that includes packing it into the
box and driving the forklift to the dock. So if we assume that the
same answering machine were offered by Heath, this is an idea of the
cost savings: Labour at Heath to pack and ship 15 Mins. Labour at

Phone factory to make, pack and ship 45 mins. Heath savings: 30 Mins. Labour cost (padded) $7.50 per hour. Savings: $3.75 . Considering that such a device would retail at K Mart for probably $115.00. It is hardly worth to saving $3.75 to spend hours building by hand what a machine can whack together with greater precision in only a few minutes.

That should explain why Heath is not such a deal these days. The break they gave you was on the manufacturing labour costs and those costs have gone away. Also to be considered, but not part of this is the impact of Surface Mounted Devices on manufacturing and repair.

You can post programs to my "community ftp" disk space. Everione has WRITE access, though only one at a time can get write access. So don't go erasing someone else's files unless they are the oldest and there is not space left. There is no security, so treat it as such.

To use it:

```
ftp vmd.cso.uiuc.edu
user anonymous
cd phil.512
binary
.
.
.
quit
```

Remember you must use binary on all non-text files. The system is an EBCDIC system and text files will be translated to EBCDIC, so for text files that were uploaded non-binary they must be downloaded non-binary so that they will be translated back to ASCII.

If you are uploading a package of files, please collect them into a single file and compress it. For UNIX stuff, please use tar format. For PC stuff please use arc, zip, or joo. For Mac, I don't know what is available. Maybe someone from ap`le.com, and a Mac-pert, can followup here and say.

REPLY COMMENTS OF PHILIP R. KARN, JR., KA9Q
.ps 10
.\".ls 2
.sp 2
.ce 1
\fBSummary\fP
.LP
In mid June and again in early August, I spent four days personally
reviewing the entire public file in PR Docket 90-55 at the Commission's
public reading room in Washington DC. The comment period closed a week
before my last visit, so I was able to review every comment that had
arrived by the August 6 deadline. I copied many of the comments and
have studied them in the weeks since. I offer these reply comments for
the Commission's consideration.
.LP
Those against the codeless license base their
position on a very small set of arguments. In my opinion, all of these
arguments are based on emotion and the protection of parochial
interests, not logic or the wider public interest. Opponents of the
codeless license refuse to recognize the rapid, dramatic advances that
characterize communications technology, and they refuse to accept that
```

amateur radio must continue to earn its spectrum by living in the
present, not the distant past.
.LP
Many make various assertions
about the superiority of the code as an operating mode. Even if these
assertions were all valid, none would not be relevant as arguments
against a codeless license. But many of the assertions are simply
\fIwrong\fP, and they reveal widespread ignorance of more modern forms
of communication.
.LP
The ARRL claims that the amateur community supports a codeless license
only if it is restricted to frequencies above 220 MHz. But the actual
comments in the file belie this claim. A clear, though not
overwhelming, majority of comments favors a codeless license. However,
most of those in favor clearly support giving Communicators access to
all frequencies above 30 MHz, while those who oppose a codeless license
would seem to oppose it under all circumstances.
.LP
The Commission's constituency, the general public, is
much broader than that of the ARRL, as licensed amateurs make up only about
0.2% of the US population. So the Commission should not give undue weight to
those parts of the ARRL's comments (especially their proposal to restrict
Communicators to 220 MHz and up) that are based more on short-term
political compromises rather than the long term interests of the
Amateur Service and the general public. I therefore urge the Commission
to disregard the comments in opposition, to create the Communicator
license, and to give it full amateur privileges above 30 MHz.
.bp
.LP
.ce 1
\fBDiscussion\fP
.LP
Due to the size of the file, it is impractical to reply to each and
every set of comments that have been filed in opposition to the
creation of a codeless license. However, several common themes occur
very frequently. In these reply comments, I have selected a few that
are representative of each argument, following each with my response.
.LP
.ce 1
\fB"Removing the code requirement would turn amateur radio into CB!"\fP
.LP
This is by far the most popular remark by die-hard opponents of a
codeless license. Here is a tiny sampling:
.QP
"The blabbers want to make Amateur Radio a race track for CBers."
(Red Barger, W3CVE, page 3.)
.QP
"The whole reason for my pursuit of the amateur radio class was
to escape the garbage which threves [sic] on the Citizens Band radio.
Do you people realize what will become of the amateur frequencies if

this no-code proposal reaches it's full potential? The same conditions will exist on HAM bands." (Mitch Mashburn)
.QP
"The code requirement at this time is keeping the rif-raf off of the ham bands. (Jim Jackson)
.LP
This argument, despite its popularity, is deeply flawed for several reasons.
.LP
First, even without a code test, applicants for the Communicator would still be required to pass a written examination equivalent to or more comprehensive than that passed by Technician class licensees. This hardly renders the Communicator license equivalent to CB, for which no license at all is required.
.LP
Second, codeless licenses exist and have been successful in many other countries. Nowhere (with the possible exception of Japan, whose extremely high population density and very simple written test makes it a special case) has the result been anything like a "CB fiasco". Indeed, I personally know several foreign amateurs who hold codeless licenses that have made significant contributions to amateur radio (more about these later.)
.LP
Third, the Citizens Radio Service is only one of many other services that do not require their operators and users to know Morse Code. Others include broadcasting, public and private land mobile (including police, fire, GMRS and business band radio), common carrier (e.g., cellular telephony), and aviation. All seem to get along just fine without a code requirement for their operators. Why single out CB for comparison?
.LP
Yes, I have actually listened to operations on the Citizens' Band. I concede that most AM operations there are hardly well disciplined. However, it's a different story in the SSB segment and the illegal "free band" above Channel 40. In general, the operators there sound like reasonably courteous people. They talk about the same things that radio amateurs talk about, and they even use amateur radio lingo and operating procedure. Except for a) an apparent inability to standardize on a given sideband, and b) a lack of call signs, I would have been hard pressed to tell this segment apart from a legitimate amateur band!
.LP
Could it be that some amateurs oppose the codeless license so emotionally because, deep inside, they see little difference between themselves and the CB operators they despise save proficiency in Morse Code? Certain spots in the amateur bands, such as 14.313MHz, sound very much like the AM portions of the CB band. Indeed, on my second visit to the Commission I saw copies of citations that had just been issued to two operators involved in "net wars" near that frequency, and both held Extra Class licenses. So much for code proficiency as a filter to the undisciplined!

.LP
It would seem that merely the ability to tune a SSB radio is sufficient
to filter out most of the undisciplined operators, yet not even a 20 wpm
code test will filter them all out.
.LP
.ce 1
\fB"I learned Morse Code so should everybody else"\fP
.LP
This is another popular comment. For example:
.QP
"I feel appalled that after all my hard work to achieve a small
portion of the HAM frequencys [sic] and many more to those who
have not worked or endured the qualifications to become an
amateur radio operator." (Mitch Mashburn)
.QP
"I worked extremely hard to earn my license and feel that everyone
else should do the same." (Virginia Watson, KA5KBP)
.LP
These arguments oppose change simply because it \fIis\fP change. The
opposition is purely emotional, and as such it really doesn't deserve
a response. All I can say is that the same attitude is
responsible for many lingering problems in our society, including
fraternity hazing and racial discrimination. I hope the Commission will
base its decision on reason, not emotion.
.LP
.ce 1
\fB"Code is an amateur radio tradition, a part of our heritage"\fP
.LP
.QP
"The code is a tradition of amateur radio ... and should be continued."
(Edward Switzer, WB8TCT)
.LP
There are many flip answers to this argument. I will even admit to
making a few: "So is spark. So are electrolytic rectifiers, crystal
sets and superregenerative receivers." And so on.
.LP
I should make it clear
that I have no objection to anyone carrying on the tradition
of Morse Code should he or she so desire. What I \fIdo\fP object to
is the notion that \fIevery\fP amateur should be \fIforced\fP to do so.
.LP
The English author Gilbert Keith Chesterton (1874-1936) had this to say
about tradition:
.QP
Tradition means giving votes to the most obscure of all classes, our
ancestors. It is the democracy of the dead. Tradition refuses to
submit to the small and arrogant oligarchy of those who merely happen
to be walking.
.LP
But such remarks don't really give proper justice to the issue because

traditions deal with such deeply held personal values and philosophies.
It deserves a serious answer on the same level.
.LP
The big problem with the "code is tradition" argument is that it
obscures the \fItrue\fP tradition and heritage of amateur radio, which is
of a completely different nature.
.LP
Let's look at the first section of the FCC rules: Part 97.1, Basis and
Purpose. Five short paragraphs list all the ways we're supposed to
justify our existence as a service (i.e., retention of our frequencies).
In summary, these are: serving the public (especially in emergencies),
advancing the radio art, training individuals in communication,
technical and engineering skills, and enhancing international goodwill.
.LP
This section first appeared in the rules as Part 12.0 in 1949. In 1951,
the "international goodwill" paragraph was added and the other parts
were amended slightly. The section has remained unchanged ever since.
.LP
Note that the authors of these paragraphs wisely omitted any reference
to a specific technology or mode of communication. The point is that
these goals transcend technology. Our goals, not Morse Code or any other mode,
are amateur radio's \fItrue\fP traditions!
.LP
One measure of how fundamental these principles are can be seen in the
fact that this was virtually the only section to emerge from the recent
FCC rewrite proposal completely unchanged. In fact, the FCC used them
as an outline for the remainder of their proposed new rules; they are
likely to carry us through the end of the century.
.LP
Think back to 1949, if you were around then. Captured German scientists
in the US and USSR were busily working on rockets, but Sputnik was still
eight years away. Who could have known that by 1990, 41 years later,
amateurs would have successfully built and launched several dozen of
their own satellites, both for experimentation and for routine world
wide communications?
.LP
In 1949 the first true electronic digital computer, the vacuum-tube
"ENIAC", was still state-of-the-art. It occupied two large rooms: one
for the computer hardware, and a second for the air conditioning. Who
then could have known that by 1990, something like half of all US hams
would own their own "personal" computers -- machines many thousands of
times more powerful than ENIAC, yet small enough to fit on a desktop or
even carry in a briefcase? Who in 1949 could have predicted that by
1990, hams would be using computer technology on a large scale to build
fully automatic traffic handling networks? (The very first packet-
switched network, the ARPANET, was still 2 decades in the future.)
.LP
Yet these newer activities are just as much in the spirit of the Basis
and Purpose of the Amateur Service as was the spark traffic handling
that originally gave the American Radio Relay League its name. Our

technologies may change, but our goals remain the same. In fact, continuous technological progress is a cornerstone of our heritage; the rules challenge us "to contribute to the advancement of the radio art" and to "advance skills in both the communication and technical phases of the art". The technology and skills that permitted us to meet our purposes in 1949 is no longer sufficient today. If we do not adapt to the times by developing and learning new and better methods of communication and de-emphasizing those that have become less relevant, we will be left behind in the ever-increasing competition for spectrum.
.LP
In the early years of amateur radio, Morse Code was all there was. To do anything useful in the service at all, you had to know it; a code requirement then made perfect sense. But the development of new modes of communication such as VHF FM, packet radio and satellites has made it possible for many amateurs to fulfill our Basis and Purpose without using Morse Code at all. So why do we continue to require it of every amateur? The code requirement has become an anachronism. Far from maintaining our "amateur radio traditions", it has diverted us further and further away from them. It is time we brought the original spirit of amateur radio back into today's world by creating a codeless license.
.LP
.ce 1
\fB"It's easy to learn the code"\fP
.LP
Ironically enough, this argument is popular with many of the same people who also maintain that the code requirement serves as a necessary test of discipline and motivation for obtaining an amateur license. For example:
.QP
"The code test is a key factor in maintaining high quality responsible operators in the Amateur ranks. Removal of the code requirements would result in greater numbers of Amateurs but with less respect for the privileges they have been granted ...
I've given dozen's of tests ... they had little difficulty with the code test..." (Allan Hardigree, WA4AON)
.LP
In other words, we need the code test because, at the same time, it both takes a lot of hard work and is very easy.
.LP
Even ignoring the obvious contradiction, this argument misses the point in several ways. Even if I accept Mr. Hardigree's and other instructors' assertions about how easily their students pass the code test, they say nothing about how many potential students don't even bother to sign up because of the existence of the code requirement. Since attendance at a licensing class is voluntary, those who do attend are a self-selected sample and are thus not representative of the general population.
.LP
Furthermore, even if the code were not a significant barrier to

otherwise qualified persons (a proposition with which I strongly
disagree), this would not argue against a codeless license. The real
issue is whether the code requirement is \fIrelevant\fP, not whether it
is hard. The record clearly shows that it is \fInot\fP relevant to
present-day VHF/UHF amateur operations and therefore should be
abolished regardless of perceptions of its difficulty.
.LP
.ce 1
\fB"Why not get rid of the written exam too?"\fP
.LP
.QP
"Here are some ideas whose time has clearly come...
The no-code license...
The no-theory license...
The 'no-English' education..." (Anonymous)
.QP
"Using much the same arguments as the proponents of a no-code
license have been using, a computer science graduate student
recently asked me why there should be a technical exam as
a license requirement. He claimed that he did not intend to
build or work on radios, but he just wanted to be able to
use a hand held transceiver to talk to people."
(Alan Larson, WA6AZP)
.LP
The first quote is typical of the sarcasm often contained in this
argument. The second quote, however, was made seriously, and deserves a
reply in kind.
.LP
The reason there should continue to be a technical written exam for an
amateur radio license (even though there should no longer be a code exam)
is easily seen in the Commission's own definition of the Amateur Service:
.QP
"A radiocommunication service for the purpose of self-training,
intercommunication and technical investigations carried out by
amateurs, that is, duly authorized persons interested in radio
technique solely with a personal aim and without pecuniary
interest." (47 CFR 97.3(a)(4))
.LP
It is certainly true that one does not need much technical
knowledge merely to operate a hand-held radio; thousands of
non-amateurs prove this every day. But merely operating a transceiver
doesn't necessarily further the Basis and Purpose of the Amateur
Service. Section 97.1 stresses the technical aspects of the service in
the context of self-training and advancing the radio art. These
activities require much more than just the knowledge of how to use a
radio, but they certainly do \fInot\fP require a knowledge of Morse
Code. And \fIthat\fP is the crucial difference between the code and
theory tests.
.LP
.ce 1

\fB"The Code Requirement is Not Keeping Out Technical People"\fP
.LP
One commenter, Robert Carpenter W3OTC, presents some curious
statistics to argue that the code requirement is not keeping out highly
technical people. He surveyed the author lists in US amateur technical
publications such as ARRL's QEX, the AMSAT Journal, and the Central
States VHF Society proceedings. He goes on to say
.QP
"100% of the amateurs mentioned in amateur satellite design,
construction, and operation held high-code-speed licenses....
ALMOST ALL OF THE PEOPLE IN HIGHLY-TECHNICAL ASPECTS OF AMATEUR
RADIO HOLD 13- or 20-WPM LICENSES." (page 3. Emphasis original)
.LP
This argument is a good example of statistics abuse. Carpenter's
analysis confuses causation with correlation.** And it says nothing about how
many \fImore\fP authors of technically oriented articles
there could have been had there been a codeless license.
.FS
In my profession, computer science, we call this error
the "refrigerator light
effect". This comes from the joke about the person who insists that the
light in his refrigerator is always on because it has been on every time
he opened the door and looked inside.
.FE
Furthermore, I would not read too much into Carpenter's assertion that
technically oriented US amateurs usually hold licensees with code speeds
above 5 wpm. From personal experience, I can say that the
step between zero wpm (i.e., no code proficiency) and 5 wpm was a \fImuch\fP
bigger hurdle than the step between 5 wpm and 13 or even 20 wpm. Once I had
learned the code, it was relatively easy for me to increase my speed, but
that first step was a killer.
.LP
Carpenter cites only the current license class of each
author in his study. He had no way of knowing the code proficiency required
by the initial license class of each individual. So he could have made an
equally invalid case that the Novice Class does not serve the interests of
technical development because so few technical authors hold Novice class
licenses. Yet many of those same authors, including myself, got their starts
through the Novice Class and later upgraded. How many would probably
never have been
licensed at all if it weren't for the Novice? I assert that the answer is
"many", including myself. And how many \fImore\fP technically oriented
people have been kept out all along by even the 5 wpm Novice/Tech code
requirement? I believe the number is even larger.
.LP
Some essential controls are notably lacking from Carpenter's study. In
particular, he cleverly excludes non-US amateurs and publications from
his figures, thus avoiding comparisons with countries that do have
codeless licenses. My own work on amateur satellites and packet radio
has introduced me to many highly productive, technically oriented

amateurs who hold (or held) codeless licenses in these other
countries. More than anything else, these contacts have convinced
me of the urgent need for a US codeless license. Here are just a few:
.IP
Peter Guelzow, DB2OS (West Germany). Peter is the primary ground
command station operator for the AMSAT-Oscar-13 satellite. As
such he leads a team responsible for ensuring the overall health of
the spacecraft and for changing operational schedules as
conditions require.
.IP
Matyaz Vitmar, YT3MV (Yugoslavia). While in the United States on a Fulbright
scholarship, Matyaz volunteered his talents and spare time to AMSAT. He
designed and built the transmitters on the AMSAT \fIMicrosat\fP satellites
launched in January. These transmitters achieved the highest efficiencies
yet for any AMSAT satellite; indeed they represent a significant advancement
of the state of the art. Before coming to the US, Matyaz published
articles in the German-language amateur publication \fIVHF Communications\fP
on his amateur digital signal processing efforts, having built
a DSP system with the Motorola 68000 microprocessor.
Matyaz's current license requires code
proficiency, but he started with a no-code license.**
.FS
Following Carpenter's reasoning, had this person been an American publishing
in US journals he would
have been included in the "technical authors that hold code licenses"
category even though much of his work was done under a codeless license from
which he has since upgraded.
.FE
.IP
Rob Janssen, PE1CHL (Netherlands). Rob is a major contributor
to my TCP/IP packet networking software project. He made the
suggestion that formed the base of my current "NOS" version of
the software, and he has developed a version of the system for
the Atari ST computer that is popular with European radio amateurs.
.LP
If Mr. Carpenter had included the proceedings of the ARRL Computer
Networking Conferences in his study, he would have noticed authors with
callsigns such as IW1PTR and several Japanese callsigns which all appear to
be foreign codeless licensees according to the International edition of the
Radio Amateur Callbook.
.LP
A quick look at a few foreign amateur publications might be in order.
The West German \fIUHF-Compendium\fP, a two-volume collection of technical
construction articles on UHF and microwave RF equipment, includes nine
codeless licensees in its list of 23 authors. (West German codeless
licensees are distinguished by DB, DC, DD and DG callsign prefixes). In a
typical issue (April 1990) of \fICQ DL\fP,
the German amateur radio magazine, a
codeless license holder co-authored an article on improved data carrier
detection in amateur packet radio, and several others had technical and

operating columns on amateur television, packet radio and satellites.
The 1982 edition of the \fIRadio Communication Handbook\fP,
published by the Radio Society of Great Britain, lists three contributors
who hold codeless licenses (G6 and G8 prefixes). And
codeless licensees are frequent contributors to the AMSAT UK and
AMSAT DL journals.
.LP
Many holders of codeless licenses have contributed to the Japanese
\fIFuji\fP and the British \fIUoSAT\fP amateur satellite projects. Nearly
everyone who has worked on \fIUoSAT\fP is a licensed amateur, and of these
approximately two-thirds to three-quarters hold British codeless licenses.**
.FS
Dr. Martin Sweeting, G3YJO, \fIUoSAT\fP project manager, personal
communication.
.FE
In contrast, over twenty American technical volunteers contributed to the
design and construction of the \fIMicrosat\fP satellites despite holding no
amateur license at all.**
.FS
Harold Price, NK6K, \fIMicrosat\fP software manager, personal communication.
.FE
These people clearly deserve Amateur licenses, but invariably they cite the
code requirement as the only reason they are not yet licensed. And without
a license it seems highly doubtful that we will be able to maintain their
enthusiasm and willingness to contribute to future projects. How long would
you be willing to continue working for free on a project that you were not
allowed to use?
.LP
.ce 1
\fBThe Supposed "Advantages" of Morse Code\fP
.LP
Many opponents of a codeless license present long and varied lists of
the supposed advantages of Morse Code over every other form of amateur
communication. But the relative merits of the Morse Code are not the
issue here. Once again, the real question is whether someone who does
not know the code can contribute to the Basis and Purpose of the
Amateur Service, a question I answer with a resounding "Yes!" If the
Commission agrees, then it ought not continue the code's unique "veto
power" over every amateur applicant, regardless of the relative merits
of the code as just one of many operating modes available to radio amateurs.
.LP
Opponents of a codeless license must know that casting the issue in
these terms makes their position completely untenable, so they cloud
the issue. They try to steer the debate toward the merits of the code
as an operating mode, often making provably false assertions in the
process. Then when we rebut these assertions, the opponents set up
straw men and act as though we are trying to ban Morse Code entirely
from the Amateur Service! For example:
.QP
"Those just starting in amateur radio and those in foreign

countries can not always afford or have available the sophisticated
equipment needed for the higher-level transmission-reception
techniques....[the codeless license] discriminates against less
financially privileged amateurs." (Michael Migliaccio, N3HLM).
.LP
This is, of course, completely ludicrous. I know of no supporter of a
codeless license who would deny others the right to use whatever
operating mode they choose, including Morse Code. All we ask is a "live and let
live" policy. Morse Code is clearly a simple mode that requires inexpensive
equipment, and many people, including me, find it enjoyable. Many
amateurs will continue using it voluntarily for these reasons.
.LP
I know I risk playing into my opponent's hands by responding to their
assertions about the merits of Morse Code as an operating mode. However, a
basic principle of propaganda is that even the most ludicrous claims
can gain credibility when repeated often enough; this is especially
true in a group as insular as US radio amateurs. No doubt these people
sincerely believe what they are saying. But this says much more about
the sorry level of understanding of fundamental communications concepts
and theory than it does about the merits of Morse Code.
.LP
So I am compelled to respond on the record to these bogus assertions
about the enormous superiority of Morse Code lest they carry undue weight with
the Commission. As many of the assertions were repeated by many
commenters, I have quoted only a few representative examples of each
type.
.LP
.ce 1
\fBMyth #1: "The Code Is An International Language"\fP
.QP
"One universal, international language in use today is Morse Code.
Persons who verbalize in different national languages can
nevertheless communicate using Morse Code." (William Smith, WB6SDE)
.QP
"CW allows people who do not speak a common language to communicate."
(Charlie Young, WA5VNV, page 2).
.QP
"The benefits of a code proficiency requirement ... include the
uniqueness of the Morse code as a universal language crossing all
cultural and language barriers..." (ARRL, page 3, footnote 4).
.LP
It is most unfortunate that even the ARRL is not above making this
silly argument.
.LP
Morse Code is a \fIcharacter set\fP, nothing more. It differs from the
the ASCII and Baudot teleprinter codes only in its use of variable
length codes (as opposed to the fixed 7-bit and 5-bit codes of ASCII
and Baudot, respectively) and in having a much smaller alphabet.
.LP
The claim for Morse Code as an aid to communication between amateurs

without a common natural language really stems from the standardized abbreviations often used in Morse communications. However, these abbreviations can and are used just as easily on packet or RTTY. **
.FS
One might also say that language is seldom a barrier in Morse communication because it is so slow and preoccupied with procedural overhead that there is little or no time for the actual exchange of any real information -- so a language barrier is never encountered!
.FE
.LP
In any event, given that most communications conducted by US amateurs on the frequencies above 30 MHz are with other English-speaking US or Canadian amateurs, it is difficult to see the supposed benefit of Morse Code to Communicator licensees even if it \fIwere\fP an "international language". Even in international communications (e.g., via satellite) so many foreign amateurs already hold codeless licenses as to make the code something less than a "universal language" - not that it ever was, of course.
.LP
.ce 1
\fBMyth #2: "Morse Code Is Needed For Emergencies"\fP
.LP
.QP
"3. All hams must be prepared to use code in an emergency situation" (Michael C. Migliaccio, N3HLM, page 1)
.QP
"When a power failure strikes computers and other digital equipment usually does not function. But the newer solid state circuit radios can be operated on battery power thus still enabling morse code communications" (Michael J. Berry, N1FNI)
.LP
The transparency of these arguments is obvious is when you look at several other major users of the VHF and UHF spectrum. I know of no Morse Code proficiency requirement for policemen, fire fighters, paramedics and dispatchers, but these radio operators seem to have little trouble handling emergency traffic. Because they do it every day, they're probably much better at it than the average amateur.
.LP
In another service, aviation, communication during instrument conditions (IFR) is so vital that a radio failure is itself grounds for declaring can emergency. Yet even a commercial pilot who routinely takes responsibility for hundreds of lives while flying IFR is not required to know the code. This is true even though VORs and NDBs (navigational beacons) identify in Morse Code. (A few do ID in voice, and in any event the Morse Code identification is written on the navigation charts in dots and dashes).
.LP
A more recent development, cellular telephony, has rapidly eclipsed amateur radio in the number of emergency calls placed to public service agencies, yet there is no code proficiency requirement for a cellular

telephone user.
.LP
Experience shows that most amateur radio emergencies are handled with VHF FM voice communications; the rest involve either SSB voice (particularly on HF) or health and welfare message traffic that is ideally suited for packet.
.LP
Not only is the "Morse Code is needed for emergencies" argument completely specious, but it actually works \fIagainst\fP the ability of the Amateur Service to respond to emergencies. The code requirement keeps out many otherwise qualified persons who could handle emergencies with the same operating modes that present amateurs already use to handle emergencies.
.LP
As for the emergency power argument, nothing precludes non-code operations from using battery or other forms of backup power. Mobile and portable radiotelephony equipment operates from non-utility power sources as a matter of course (e.g., battery packs or automobile electrical systems) and many fixed operations (e.g., voice repeaters) also have backup power supplies. My own amateur packet radio station has an uninterruptible power supply.
.LP
.ce 1
\fBMyth #3: "The Code Requires the Simplest Equipment"\fP
.LP
This argument is often presented in tandem with the "code is needed for emergencies" argument. A romantic fantasy is usually painted of a resourceful and clever amateur improvising communication facilities in the aftermath of some dire catastrophe and saving the day. Naturally, these facilities are only capable of supporting Morse Code, and the simplicity of a Morse Code radio transmitter is heavily stressed. For example:
.QP
"Morse Code is the most effective means of communicating and the only one which can be used under the most adverse conditions. In an emergency a person could get a message across with the use [of] Morse Code by stripping two wires and touching them together in a make + break fashion." (Alan Kaiser, N1API)
.QP
"CW signals will penetrate when all other forms of communication is [sic] disrupted ... given a true emergency, a CW transmitter and receiver is the simplest equipment to build, operate, or repair and uses the least power. Given a true emergency, the modern equipment may be made inoperable for any number of reasons. If it does become inoperable, repairs could be impossible while a simple transmitter could be constructed out of most junk-part boxes which could summon help." (John Ridgely, WA3YVU)
.LP
The main fallacy in this argument is apparent from the old amateur saying: "If you can't hear 'em, you can't work 'em." In other words, in

their zeal to promote the simplicity of the Morse Code \fItransmitter\fP, the Morse Code
\fIreceiver\fP is usually ignored. Unfortunately, receivers (especially those with the necessary frequency selectivity and stability for Morse Code operation) are invariably much more complex than Morse Code transmitters. If simplicity of improvised equipment were the crucial factor, \fIAM phone\fP, not Morse Code, would be the preferred mode. Only AM can be received on the simplest (and most easily improvised) of all receivers - the crystal set.
.LP
Nevertheless, the scenarios painted in these arguments seem awfully contrived. I wonder how prepared these commenters actually are, or whether they've ever participated in any emergencies themselves. Those who have know that a far more realistic approach to emergency preparedness includes a) having tools, spare equipment and power sources on hand, and b) developing the technical skills necessary to repair failures and to improvise solutions when possible.
.LP
.ce 1
\fBMyth #4: "CW is the most efficient operating mode."\fP
.QP
"1) Lower power required for DX (distance) communication [...]
.sp
"3) Most efficient means of radio communication [...]
.sp
"6) Spectrum conservation, uses fraction of the bandwidth.
Economy of bandwidth, CW uses 1/20 that of voice (phone.)"
(Michael C. Migliaccio, N3HLM, page 3)
.QP
"I do not favor a codeless license because the CW mode encourages the construction of low cost but efficient transmitters and receivers and useful contacts are made on CW with very little power, thus complying with the Communications Act [sic] 97.313(a)."
(WO6I)
.QP
"[Morse Code's] spectrum efficiency and power-efficiency as a communications mode..." (ARRL, page 3, footnote 4).
.LP
There are two problems with this argument. First, even if one assumes that Morse Code is the most (bandwidth) efficient mode, why should this demand code proficiency of all operators, even those operating only on the underutilized upper VHF, UHF and microwave bands where bandwidth is relatively plentiful? **
.FS
This does not apply to the ARRL quote, since its context is primarily that of HF communications; but the other comments make no such distinction between HF and VHF/UHF operations.
.FE
.LP
But a much worse flaw in these claims, including the League's, is that

the basic premise is clearly and demonstrably false! When compared objectively with modern digital communication techniques, Morse Code is easily shown to be neither power or bandwidth efficient.**
.FS
A rhetorical question: If Morse Code were so 'efficient', why wasn't it chosen for deep space planetary probes such as Pioneer and Voyager, easily the most "QRP" (power-limited) communication links ever built?
.FE
.LP
Many people confuse "spectral efficiency" with "minimum bandwidth," e.g., by claiming that Morse Code is more efficient than SSB because it takes less bandwidth. But a proper measure of efficiency must take into account the rate at which information is being sent; most people talk faster than they can send Morse Code, so it's reasonable that SSB should take more power and bandwidth. The same is true for packet transmissions.**
.FS
Admittedly, a true cynic might retort that amateur QSOs transfer no useful information anyway, so that bandwidth \fIshould\fP be the sole criterion.
.FE
.LP
Appendix 1 contains a tutorial on the relative "Shannon Efficiencies" of Morse Code and other digital modes. It shows that Morse Code is extraordinarily
\fIinefficient\fP even in comparison to present amateur digital communication techniques such as packet radio, which themselves have substantial room for improvement.
.LP
.ce 1
\fB"Morse Code \fIis\fP Used Above 30 MHz"\fP
.LP
Some commenters point out that the code is occasionally used above 30 MHz. For example,
.QP
"Above 30 MHz, Morse Code is used extensively, for station identification,
e.g., repeaters; for weak signal and microwave communications; for satellite communications; for satellite bulletins; and for propagation beacons." (Richard Bisbey, NG6Q)
.LP
Mr. Bisbey is correct that the code is used for these functions, although
I would dispute his use of the word "extensively". Yet this argument attacks a straw man; no one ever said that Morse Code is \fInever\fP used above 30 MHz, only that it is an incidental mode that does not justify a code requirement.
.LP
But to answer his specific points, many (if not most) repeaters now identify with voice synthesizers, either exclusively or in addition to Morse Code. Moreover, it is not really necessary that operators be able to copy these IDs in order to use repeaters

effectively;
the fact that so many repeaters identify at speeds well in excess of 5
wpm,
the speed required for the Technician class license, illustrates this.
Furthermore, paging services in the Land Mobile service often identify
in
Morse Code, but there is no requirement for code proficiency to use a
pocket pager.
.LP
As for the other uses of the code above 30 MHz, they are by no means
exclusive. They still do not justify a code requirement for amateurs
interested in alternative modes of communications any more than the use
of ASCII in amateur packet radio would justify requiring all operators
to memorize that character set.
.LP
Most satellite communications now use single sideband (SSB),
except for the \fIMicrosat\fP satellites that use packet radio modes
exclusively.**
.FS
The \fILUSAT\fP satellite (one of the four \fIMicrosats\fP) does carry
a
Morse Code beacon, but it has been turned off in favor of the 1200 b/s
digital
packet stream because the latter makes much more efficient use of the
satellite's resources.
.FE
As for microwave communications, it is unlikely that Morse Code
operations
will ever take up more than a tiny fraction of the available spectrum.
Potentially far
more important and effective uses of this almost idle spectrum can
be seen in the high speed digital communications experiments now being
conducted by Bdale Garbee, N3EUA; Glenn Elmore, N6GN; and Kevin Rowett,
N6RCE. They have built and tested prototype 2.5 Mb/s digital links that
show enormous potential for use in "backbone" integrated voice, data
and image networks that could revolutionize amateur radio, particularly
as an emergency communications service capable of handling large
amounts
of traffic.
.LP
In short, although Morse Code is used by a tiny fraction of
communications
on the frequencies above 30 MHz, it is far from an essential skill
for the radio amateur using those frequencies. Alternative techniques
exist and new ones are being developed. Those who wish to learn
and use the code will still be allowed to do so, but there is no reason
to
force it on them.
.LP
.ce 1

\fBFull VHF/UHF Privileges Should Be Granted To Communicators\fP
.LP
Although I did not try to keep a precise count (the bulk of the file and the presence of many duplicate copies of filings made this impractical) it appears that a majority favors some form of codeless license. And there is, of course, a highly vocal minority that opposes a codeless license in any form. However, I discovered a most interesting fact: an overwhelming majority of those who did favor some form of codeless license felt that full privileges above 30 MHz should be granted. Even several commenters who opposed a codeless license felt that if it were to be created anyway, it should carry all privileges above 30 MHz.
.LP
The ARRL states
.QP
"...the League's ascertainment of amateur licensees' attitudes about a codeless license indicated that there was a great deal of acceptance of a codeless license if the privileges were limited to frequencies above 220 MHz. Support dropped off significantly for such a license with privileges below that frequency band..." (ARRL, page 16).
.LP
My examination of the file would seem to belie this claim. Either amateur
sentiment on the codeless license has polarized considerably since the ARRL gathered its statistics, or the ARRL surveys were designed primarily to gather support for its own half-hearted proposal.
.LP
The latter would seem to be the case. For example, the member survey distributed in the ARRL Hudson Division (where I live) contained check-off responses providing for complete opposition to a codeless license; support for a codeless license as proposed by the ARRL's study committee (220 MHz and up, plus limited packet privileges on 2m); or support for a codeless license more restrictive than that proposed by the study committee. There was no check-off response to express support for a codeless license granting full VHF/UHF privileges.
.LP
The fact that the ARRL has advocated these illogical restrictions on the proposed Communicator belies its claim to having submitted a "cohesive plan". It is clear that the League was caught between two rival factions: those who support a codeless license on all VHF/UHF frequencies and those who oppose it entirely. The League proposed to restrict the Communicators to 220 MHz and above primarily to lessen the opposition from the anti-codeless faction, since few from this group operate on those bands.
.LP
It is clear that the real reason some amateurs oppose granting full VHF/UHF privileges to Communicator licensees is their perception that the 50 and 144 MHz bands are too "full" to support additional amateurs. Indeed, 144 MHz is the only VHF/UHF band many amateurs use.

And some others, including the Sidewinders on Two, William Tynan W3XO and AMSAT, are specifically concerned about
possible interference to weak signal work on these bands.
.LP
But none of these concerns constitute valid arguments against granting full privileges above 30 MHz to Communicators. Communicator licensees will have passed a written exam equivalent to or more difficult than the Technician Class which does grant full privileges above 30 MHz. These licensees should therefore be no less able to
adhere to FCC rules and regulations and to voluntary band plans.
Given the rarity of Morse Code in operations above 30 MHz, denying the Communicators access to the 50 and 144 MHz bands can be seen only as as a
form of "protectionism" for a small special interest group, i.e., those already licensed who now enjoy relatively exclusive use of the 50 and 144 MHz
bands.
In other words, NIMBY - Not In My Back Yard - is the dominant principle here.
.LP
This is not to say that the gates to amateur radio should be thrown completely open. As discussed earlier, amateurs must exhibit a certain minimum level of technical proficiency if their use of the service is to further its reason for being. And highly worthwhile activities do go on in the weak signal band segments. But even if, in order to prevent overcrowding, it were deemed necessary to increase the difficulty of an amateur exam above the minimum levels, there are far more constructive ways to do it than by retaining a code test. For amateur radio to serve the broader public interest, the skills required for an amateur license should promote development of the service and of the individual in a way that maximizes the benefit of the Amateur Service to the outside world. Code proficiency is virtually irrelevant outside amateur radio, therefore maintaining a code requirement is indefensible even as a means of preventing overpopulation of the amateur bands. If overpopulation is the problem, then increase the \fItechnical\fP qualifications instead.
.LP
Furthermore, I believe the concern about overpopulation is overstated. The file contains many comments from amateurs living in rural areas who report that much of even the 144 MHz band goes idle. For example:
.QP
"There may be those who say this would cause the popular FM repeater frequencies to become too crowded. However, I live in the rural area of Northern Wisconsin, ...
and we welcome any additions to the number of hams and the number of repeaters." (William P. Volm, KD9HH)
.LP
Much of the congestion that does exist on the 144 MHz
band in larger metropolitan areas

is the result of highly inefficient spectrum management policies.
The burden of improving spectrum efficiency and of developing the less
used upper frequency bands should be shared equally by \fIall\fP
amateurs. One's level of code proficiency should be irrelevant.
William Volm continues:
.QP
Perhaps allowing the use of 144 MHz and above for
these "codeless" hams would cause us to better utilize other parts of
the VHF and UHF radio spectrum in the city as well as the country.
If 2 meters becomes more crowded we will just begin using other bands
we may not be using as much of now.
So I don't really see this as a threat but as a help to better
spectrum management."
.LP
.ce 1
\fB"The Glory of Morse Code"\fP
.LP
In order to close on a somewhat lighter note, I would like to respond
to one more statement I found in the file:
.QP
"I believe everyone should be blessed with the glory of learning
code before operating in the amateur frequency spectrum."
(D. J. Ray, N5FRN)
.LP
Finally, a comment that puts in eloquent words what so many who oppose
the codeless license seem to feel. With the words "blessed with the
glory" Mr. Ray expresses what can only be a religious attachment to the
Morse Code. However, the First Amendment to the Constitution of the
United States reads:
.QP
"Congress shall make no law respecting an
establishment of religion, or prohibiting the free exercise thereof..."
.LP
Given the religious attachment that Mr. Ray and many other amateurs
clearly have for the Morse Code, it would be unconstitutional for the
Commission either to ban the use of Morse Code by Mr. Ray or to require
other amateurs to follow his religious practices. The code
requirement is therefore in violation of our Constitutionally mandated
separation of Church and State, and the Communicator license must be
implemented without delay.
.LP
More seriously, all I ask is for the Commission (and the members of the
Amateur Service) to allow each amateur to pursue the Basis and Purpose
of the Amateur Service in his or her own way.
.LP
Respectfully submitted,
.sp 3
Philip R. Karn, Jr., KA9Q

\fBAppendix 1 - The Shannon efficiencies of Morse Code and other digital
modes\fP
.LP
About forty years ago, Claude Shannon of Bell Labs launched the field
of Information Theory with a foundation paper on the mathematical basis
of communication. His paper introduced a formula that is now
universally accepted as being to communications what E = mc^2 is to
nuclear physics and the Laws of Thermodynamics are to engine design.
What Shannon found was the ultimate limit imposed by nature on the rate
at which digital information can be sent through a noisy,
bandwidth-limited channel. Here is his formula:
.IP
C = B * log2(1 + S/N)
.sp
where
.sp
C = channel capacity in bits/second

.sp
B = channel bandwidth in hertz
.sp
S/N = numerical signal-to-noise power ratio (e.g., 30 dB corresponds
to a power ratio of 1000). "Gaussian" (i.e., "white") noise is assumed.
.sp
log2() = base 2 logarithm (You can compute this on your pocket
calculator by using base-10 logs and dividing the result by .301,
the base-10 log of 2.)
.LP
For example, a 3 KHz channel with a 30 dB S/N ratio has a Shannon limit
of
.IP
3000 * log2(1 + 1000)
.sp
= 3000 * 9.96
.sp
= 29.9 kilobits/sec.
.LP
Unfortunately, Shannon's formula doesn't give a communications engineer
much
more than a hint about how to build a system that operates at the
theoretical limit, just as the Second Law of Thermodynamics doesn't
really
tell a turbine designer how best to shape his blades. But both are
useful
benchmarks for looking at the efficiencies of various systems, and they
tell
you how much each system could be improved. For example, the figures I
just
gave are typical for a dialup phone line. Modems are now readily
available
that operate at rates of 10,000 to 15,000 bits/sec over these lines, so
you
can see that they are already operating at 33% to 50% of the Shannon
limit.
I will call these percentages the "Shannon efficiencies" of the system.
.LP
If someone advertises a modem operating at 100,000 bits/sec over
ordinary 3
KHz 30 dB S/N dialup phone lines, you can safely take it as either an
April
Fool's joke or a fraud. It is vitally important to understand that you
cannot build a system that exceeds the Shannon limit any more than you
can
build a perpetual motion machine; it doesn't matter whether the
"receiver"
is a machine or the human ear and brain. (Perpetual motion is actually
more
than just an analogy here; there is an interesting link between

information
theory and thermodynamics that is outside the scope of this document.
Read up
on "Maxwell's Demon" in a physics textbook if you're interested).
.LP
Now armed with this background, I can return to the original subject.
Let's see how efficiently a Morse Code signal uses its channel. I'll
assume a
bandwidth of 400 Hz (a typical CW filter) and a S/N ratio of 10 dB in
this bandwidth. I'll also assume a transmission speed of 20 WPM. From
my own experience I can say that this represents reasonably comfortable
copy.
.LP
The Shannon capacity of the channel is
.IP
400 * log2(1 + 10)
.sp
= 1384 bits/sec
.LP
The Morse alphabet has 58 characters, including space and seldom-used
punctuation, so each character could be represented as a 6-bit number
with
room to spare (2^6 = 64). The standard word "PARIS " sent 20 times in
one
minute is 120 characters/minute, or 2 characters/sec. At 6
bits/character,
20 WPM Morse Code is therefore about 12 bits/sec of information, for a
"Shannon efficiency" of 12/1384, or only 0.87%.
.LP
In comparison, the TAPR/AMSAT PSK modem (designed for the \fIFuji\fP
and
\fIMicrosat\fP satellite downlinks) operates at 1200 bits/sec. It
requires a
bandwidth of about 1800 Hz and a S/N ratio of about 10 dB to work well.
Such a channel has a Shannon limit of about 6227 bits/sec, so this
modem
operates at 19.3% efficiency. Even though this figure isn't
particularly
high in comparison to the phone line modems mentioned earlier, it blows
away
the Morse Code figure I just computed. (The reason this modem isn't as
good as the
better phone line modems has to do with the choice of a much simpler
coding
and modulation scheme that could be implemented easily in inexpensive
analog
hardware. The fast phone modems make heavy use of Digital Signal
Processing, or DSP. As we apply DSP to amateur radio, modem
efficiencies
will rise considerably. But if I pick a weaker competitor, e.g., the

1200
baud Bell 212A modem, our modem does well -- the 212A is only about 4%
efficient.)
.LP
Why is Morse Code so inefficient? There are several reasons. First is
the design of
the code itself. It takes anywhere from 4 to 26 "channel bit times" to
send
each character (4 for the letter "E", 26 for the digit "0"). Even when
the
various character lengths are weighted for their frequency of occurrence
in
English, the average Morse character is 8.3 bits long, slightly more
than
ASCII with the parity bit -- even though ASCII has a much richer
alphabet
(128 characters vs 58).
.LP
Second, the on-off keying used with manually copied Morse is inherently
less
efficient than the continuous-carrier phase or frequency shift schemes
generally used with machine-copied signals. The average-to-peak signal
power
ratio is low, so the transmitter is not used effectively and the error
rate
suffers. (Of course, some CW transmitters cannot handle continuous
output,
which mitigates this difference.) On-off keying also has two other
serious
drawbacks, such as the difficulty in setting a detection "threshold"
(deciding whether the signal is on or off) in the presence of fading and
the
inability to gain the additional 3 dB in performance that comes with
"coherent carrier recovery." The latter technique involves phase-locking
a
local oscillator to the incoming carrier frequency so that noise and
QRM
with different phases can be rejected. This is obviously not possible
with
manual reception. What is commonly known as "Coherent CW" is coherent
only
in the element (bit clock) timing, not the RF carrier phase; it's hard
to
stay phase locked to a carrier that keeps switching off for long
periods.
But coherent clock recovery is done in virtually all synchronous
digital
modems, and coherent carrier recovery is standard practice with high
performance modems such as the TAPR/AMSAT PSK modem.
.LP

The third and most significant reason for Morse Code's inefficiency is the human
brain's requirement for considerable "excess bandwidth" to make the beginning and end of each code element (dit or dah) crisp and easy to copy.
CW filters are seldom narrower than 400 Hz, even though 20 WPM CW could theoretically fit into a 24 Hz channel.
.LP
In contrast, digital signals that are designed expressly for computer reception can make much better use of both signal power and bandwidth than Morse Code. Starting with the encoding of the source text information,
50%-70% can be shaved right off the top by applying a compression algorithm (e.g., the popular PKZIP program for the IBM PC). The average character size for English text drops to only 3-4 bits, despite the larger alphabet. Unlike the abbreviations commonly used with Morse Code, this
compression is fully reversible; the original, uncompressed characters come out of the decompressor at the receiver.
.LP
The Shannon formula shows that channel capacity depends on both the bandwidth and the signal-to-noise ratio. Depending on which you have more
of, you can trade off one parameter in favor of the other. FM is a familiar
technique for doing this with analog signals. But many more options are available to the digital designer. For example, when power is precious,
forward error correction coding (FEC) can be used to lower the required signal power at the expense of increasing the required bandwidth. (One scheme used for deep space communications lowers the required signal power
by 8 dB but triples the required bandwidth. Less drastic schemes require
less bandwidth, but give correspondingly less "coding gain".) When bandwidth
is limited but S/N is good, you can make the opposite trade by sending more
than one bit at a time. This is common on telephone modems. Sometimes the two techniques are combined, as in the new V.32 9600bps phone modems.
.LP
Irrespective of S/N-bandwidth tradeoffs, computer-based digital systems can
be scaled to operate over a much wider range of speeds and signal levels
than is possible with the human ear. Everyone knows that computers can operate at speeds far higher than human-copied Morse Code. Not as well known is that
they can go much further than humans in the opposite direction:

recovering
slow but extremely weak signals. (The slower a digital signal, the less
bandwidth it occupies. The narrower the signal, the narrower the
receive
filter can be, and the less noise it will "let in" to interfere with
the
desired signal. Hence it is theoretically possible to copy an
arbitrarily
weak signal -- as long as you slow it down enough.) But it is well
established that the trained human ear/brain can "filter" down only to
effective bandwidths of 50 Hz or so.
.LP
Machine reception has no such inherent limitation. For example, the
TAPR/AMSAT modem could, through proper scaling of component values,
operate
at 12 bits/sec -- the equivalent of 20 WPM Morse. It would only
require
about 18 Hz of bandwidth and 20 dB less signal power than for 1200
bits/sec.
In the original 1800 Hz bandwidth, this signal would be 10 dB below the
noise! Yet the modem would work just as well as before -- only slower.
The
only problem here is that narrow analog filters tend to be hard to tame,
and
this modified modem might not work well in practice.
.LP
Here DSP comes in. DSP filters are inherently far more stable and
predictable than their analog cousins, and there is effectively no
lower
bandwidth limit to such a system. For example, several years ago Bob
McGwier, N4HY, wrote software that demodulated 4 bit/sec digital
signals
sent from the Soviet Vega balloon probe as it floated through the
atmosphere
of Venus. These signals were so weak that they weren't even audible
when
played back through a speaker, yet Bob's software recovered them
perfectly!
Bob and Tom Clark, W3IWI, are now bringing these same techniques to
amateur radio. In an early demonstration, Bob and Tom worked each other
off
the moon on 432 MHz using only 100 watts into single yagis -- Oscar
class
stations, not your standard EME setup! The secret was digital signal
processing on the receiving end that made it possible to detect a
signal
that was, to the ear, completely buried in the noise. The Shannon limit
was
not violated (i.e., the information rate was VERY slow) but at least
DSP

made it possible.

1075. Hawaii Repeaters (for AA4MW)

Tel No: 656-1158

TO: Remote Addressee (_INFO-HAMS%UCSD.EDU@UUNET.UU.NET)

Subject: Hawaii Repeaters (for AA4MW)

Couldn't get this thru direct, sorry 'bout that...

Mike,

Here's a list of some of the more active Hawaii repeaters, based on my
experience on 2 meters. For 440, I've pulled listings from the RD based
on linkages with other known active systems...

Honolulu: 146.98 City Hall 444.5+
146.88* Diamond Head 444.1+
147.12 HTCARC 444.0+
147.28 444.45+
146.76 North Shore 448.0-
146.94* Haleakala, Maui

Hilo 145.35 449.75-

Kailua-Kona 147.16
146.82*
146.88

* indicates state-wide link via 444.15/449.15; Big Island end may not
be up by the time you get here.

Also -- Emergency Amateur Radio Club (EARC) net meets nightly at 1930 local
on 146.88 and 146.94 systems...you're quite welcome to check in.

73,
Jeff WD6CQV/KH6 AFA8JM

added note for info-hams -- if I'm wrong about some of this, KH6R or
someone else wil probably let me know :-)!

1076. Redicom UHF Info

Newsgroup: rec.ham-radio
Date: 1990-09-12 02:38:31 UTC
From: scotto@crash.cts.com
Message-ID: <4366@crash.cts.com>
Source record: 8537

I just came into possesion of a Redicom XF742 6-channel, crystal controlled,
25 Watt UHF radio. It looks like it was originally on RX 463.750 (TX +5)
with PL. There is also a marking on the heat-sink that says "UHF-L"

I would like to put this radio in the 440-460 area. Does anyone know if
there is a source for Redicom schematics/service manuals?

Thanks in advance!

Newsgroup: rec.ham-radio
Date: 1990-09-12 02:57:02 UTC
From: rah@public.BTR.COM
Message-ID: <383@public.BTR.COM>
Source record: 8538

Keywords:

To everyone who sent me mail, or posted replys to my aviation/ham transceiver question: Thanks!

Unfortunately, the quest was a doomed one. I called virtually every manufacturer and dealer to no avail. Bendix-King and others make a marine/ham tranceiver.. but it's not quite what I was looking for. Aszden makes a 2m mobile that also RECEIVES aviation, but again... not quite.

Well, it's nice to have a definitive answer. Now I have to think about which radio to buy first!

Another quick question... Exactly which punctuation and prosigns do I need to know for the code test?? "Tune in the World" has NO description of the Morse Code in a character <-> pattern list !? Neither do the other popular Novice or Technician manuals I've purchased. I finally used the Encyclopedia Britannica as a reference.

Regards,

-Rick-

1078. FT-470 mods

Newsgroup: rec.ham-radio
Date: 1990-09-12 03:46:00 UTC
From: clemon@lemsys.UUCP
Message-ID: <02376.AA02376@lemsys.UUCP>
Source record: 8539

I was just curious whether the current FT-470 mods will allow
receive coverage down to about 411 Mhz. I'm interested in this because if
(when) I get one I'd kinda like it to replace my scanner and Toronto FD is
411-412 MHz (414-415 Access).

<Ostentatious, net-bandwidth wasting protest deleted.>

>MAKE YOUR FILES AVAILABLE FOR FTP OR MAIL TO INDIVIDUALS PLEASE!
>THANK YOU.

Well, gosh, I thought it was nice. It's PC and clone thereof specific, of course, but enough of us run such boxes that it seems worthwhile to me.

I see nothing wrong with this, as long as it doesn't become so widespread and frequent that it generates unreasonable load on the net. Considering the level of traffic that constitutes nothing but mutual flaming on some of the "philosophical" (read: political and religious) groups, I can't see cause for complaint. It's not as if you had to _read_ those uuencoded files. The 'n' key is located one row down, and just to the left of your right index finger....

Now, while I uudecoded it on a mainframe, I _could_ have downloaded the encoded file and extracted the compressed file on my PC. I didn't, on account of because the .zoo file is much smaller, and therefore transfers to the '286 box here at n5gax much faster.

It's a nit, but I can't resist...those WERE text files. That's what uuen/decode is all about -- they make a binary file into a text file guaranteed to be transmittable over even the oldest (insert your favorite malediction here) mailer and news software. Can you say "downward compatible"? I knew you could....

Perhaps I should curb the sarcasm a bit...I don't _know_ what you're using to read the news. You might actually have to go through every file line-by-line, but I figure that's only if your using a mailer that runs under OS/360 JCL.

So, my remark is "Thank you, Mark."

2000 millicents, on the barrelhead.

73s,
d

PS -- Perhaps I should have asked: "Can you say upgrade?"
d

AO-10: Alamanac Data

de DB2OS @ DK0MAV

OSCAR-10 ALAMANAC DATA

by James Miller G3RUH

Oscar-10 can no longer be commanded due to its damaged memory. However
it's on the Mode B transponder all the time and provides very useful
service. Apogee lies close to the Equator (like it was at launch). The
attitude is "back to front", i.e. Earth pointing at perigee.

The table below lists relevant operational parameters. It is important to
realise that the current attitude (and hence Sun angle) is extrapolated
from the last known attitude, which was in January 1987, nearly 4 years
ago. The true attitude isn't far off.

The governing factor is the Sun angle. If this exceeds 45 degrees, the
the solar panel illumination is too low, the battery voltage falls, and
the beacon starts to warble.

Thus the APROXIMATE time when AO-10 is expected to be healthy again is
1990 Nov 17 - 1991 Feb 09. Listen to the beacon to make sure.

1082. Technical Publication Announced

Newsgroup: rec.ham-radio
Date: 1990-09-12 13:36:31 UTC
From: feg@moss.ATT.COM
Message-ID: <1990Sep12.133631.7939@cbnewsl.att.com>
Source record: 8543

Awhile back, when HR ceased publication, there was a
considerable thread of discussion in this group bemoaning
the loss of a ham-oriented technical publication that
Ham Radio magazine represented.

I have received a letter from Terry Northrup of
CQ Communications, Inc. Greenville, NH which
announces a quarterly she names Communictions Quarterly--
The Journal of Communications Technology.

This letter was addressed to authors who have been published
in Ham Radio (and presumably others on this net also have
received this letter).

The letter runs nearly two full pages and I will copy just
a few paragraphs just to give a flavor of this announcement
and what is proposed.

Terry also informs me that promotional material is being
mailed to all former subscribers of HR and to the current
subscriber list of CQ magazine.

Forrest Gehrke k2bt

September 5, 1990

Dear Author:
.....

When HAM RADIO Magazine ceased publication this June, Amateur
Radio lost a valuable outlet for sharing your technical expertise,
new theories, and projects. I'd like to offer you a new opportunity
to reach dedicated Radio Amateurs--those constantly looking for
technical challenges, not contest results or news and views.

.....

You now have a unique opportunity to reach this audience by
writing for our new publication .....The Journal of Communications
Technology. This new journal, scheduled to premier mid-November
1990, is geared to explore, in-depth, areas that none of the
other Amateur magazines are currently covering. I'm looking
for articles which push the technical envelope to the limit.
I'd like you to share your knowledge of electronics and
communications in such areas as direct digital synthesis,
digital signal processing, computer control, high speed data

communications, and computer-generated antenna design. A desirable article will show how new, state-of-the-art developments relate to the current Amateur Radio operations.

.....

Each issue will have approximately 100 pages of editorial material; advertising will be strictly limited. Articles will flow from page to page without the distraction of ads placed in the middle. .....

And, of course, you'll be paid for your efforts. We pay $40 per printed page.....

So, how about it? Can I count on your help to ensure that Communications Quarterly presents the best technical articles available?

1083. PRO-34 UHF Sensitivity

Newsgroup: rec.ham-radio
Date: 1990-09-12 14:38:40 UTC
From: charlie@oakhill.UUCP
Message-ID: <3806@radio.oakhill.UUCP>
Source record: 8544

I have noticed that my PRO-34 is not as sensitive as some of
my other scanners. In particular, on the UHF band around 460MHz.
Has anyone else noticed this problem. The manual says the sensitivity
is only 1uV....not particularly stellar performance.

BTW I have also noticed that image rejection in the 800MHz band is
stated as "not specified" making me think that the PRO-34
probably has prettly lousy 800MHz image rejection...since I can
hear cellular images on my unmodified '34.

Inquiring Radio-roids want to know......

Richard,

I couldn't get mail back to you, either. What came through looks like it forgot to decompress. Anyway, in my 3000, on the "TX" pc assy, (not the power amp) look for Q436, a 74C00 IC. Near it should be a couple of pots, VR412 (tone freq), and VR411 (output level). Test point 406 will show you the freq, but not the level. The osc. runs only with the PTT line low (xmit). It has been many moons since I've been in there, so I can't describe it any better. This is just from the schematic. As you can probably tell, this 3000 may be different than the basenote author's. This radio has the whole thing built in from the factory with a "TONE" on/off switch on top of the control head.

By the way, I've already copied the manual, schematic, and TT stuff. For the price of postage, you can have it. I'm probably NOT good in the book. I don't even have a book. Send me your addr. if ya want this stuff.

Now that school is back in session, it might be time to start thinking about "hooking up" a few of the university clubs around the globe.

I'm STILL interested in seeing if we can set up a chess tournament by amateur radio. If not Chess, then GO, which is very popular at R.I.T. It would not only be good to let other groups within the schools know about the ARC, but it's good PR, too. It would be even better if there was a club outside the U.S. (obviously, who shares a third party agreement with the U.S.). Sound worthwhile? Drop me E-MAIL, PLEASE!

Second thing: whoever is responsible for the HAM-UNIV mailing list, (is it you, Phil?) - does it still exist? It might be a good time to post a blurb on what it is, who it's for, and how to use it.

Finally: I'm interested in setting up a net for university ham clubs. But, I don't want to do the work. (Aren't I a squeaker?) Again, is anybody interested ?

As usual, I'm available as cep4478@ultb.isc.rit.edu or to my CCI (work) address, or by telephone. Best 73's

you folks really got my curiosity up now.

In the past, several people have posted files (non-text type) incredibly long to this newsgroup and gotten flamed to a cinder for it. I don't know how most of you read this newsgroup, but here we get a digest of so many mesages all in a row, and it comes as one long message. This thing is displayed one 24 line page at a time and you hit return to get to the next page. If you hit 'N', you end that digest and go to the next one. There is no way to reply to individual messages, nor include them in your reply without retyping the whole thing. This is a VAX/VMS system with over 1600 accounts and over 4000 users.

Did the other folks who commented on these postings get flamed as bad as me?

Oh well, That's life. I guess if I can page through endless pages of garbage on no-code, is Pump up the Volume really bad for ham radio, and whether or not I can use my radio on an airplane, I can page through fourteen tons of uhrvg;ondm picrjgih r cjehhv;jcu4coyy37yedddh iuyp97y5u d jkrhjjehkv;jn ;jhj type stuff.

first Amendment and all that i suppose. isn't America wonderful? i can't pray in school, but I can sure cuss people out and tell them where to go.
(oops wrong newsgroup, thought I was in rec.ACLU)

Anyhow, ya'll have a nice day and I'll crawl back into my Nomex Bunker gear.

FCC says it's in the middle east. Most likely Iraq. Encrypted teletype.
It's big-time loud here on the east coast.
-Rick WA1SPT/4

I was just about to post something like this when Rick's posting appeared.
AA5ME in Dallas called the FCC last Friday, they got fixes on it from six
stations and said it is roughly on the Syria-Turkey border, close to Iraq.
I heard it again today, centered on 21005, and this time it was more radar-
like, with bursts of what sounded very like our old friend the Woodpecker.
It was S9+. Obvious guess is that it could be US radar, and a more obvious
guess is that they will not turn if off for the hams...

If you haven't come across this yet, be prepared for a nasty shock. AA5ME
says it went on for many hours in the afternoon (that's when I've heard it).
It must be Megawatts. You may as well forget about 15m during the next CW
contest (did anyone wake up?).

Perhaps it's unpatriotic of me to mention about it - I suppose it's just
keeping the world safe for democracy and Exxon.

> anyway.

This raises a side of electronics that has been a quiet revolution.
It is also something that has made it as cheap to make stuff in
Switzerland as Malaya. I am going to try to be brief here so forgive
me if I miss anything.

Back in the 60s when most of my generation were taking drugs and
telling me they had learned how to "communicate" I was learning that
"electronics" was one of the most labour intensive industries. These
were the days when PC boards were coming in, but many companies like
Tektronics were still making stuff with glowfets and point to point
wiring. Building radios and stuff was a semi-skilled activity. It took
a large amount of time to build and align a Collins S line or Racal
RA-117 radio. This is what had to be paid for. Labour was a major part
of the cost of an electronic device. In these days, Heath was a deal
because the i supplied the labour and called it pleasure.

Then PC boards and ICs came in and the labour to function ratio went
to hell. To reduce labour further, automatic assembly and test
equipment came into being. So these days instead of rooms full of
women with smoking soldering irons we have halls filled with automatic
machinery stuffing multilayer boards, soldering them and testing
them. Whackity-whak and out comes an XT board that retails for $80.00.
A receiver in a chip costs $3.50.

The last product that I ever worked on getting to market was an
answering machine with combined phone and dialer. The device had 45
mins of human labour time total and that includes packing it into the
box and driving the forklift to the dock. So if we assume that the
same answering machine were offered by Heath, this is an idea of the

cost savings: Labour at Heath to pack and ship 15 Mins. Labour at Phone factory to make, pack and ship 45 mins. Heath savings: 30 Mins. Labour cost (padded) $7.50 per hour. Savings: $3.75 . Considering that such a device would retail at K Mart for probably $115.00. It is hardly worth to saving $3.75 to spend hours building by hand what a machine can whack together with greater precision in only a few minutes.

That should explain why Heath is not such a deal these days. The break they gave you was on the manufacturing labour costs and those costs have gone away. Also to be considered, but not part of this is the impact of Surface Mounted Devices on manufacturing and repair.

Unlike sites slopping on the government trough, a lot of Usenet
does not have Internet access, and can't FTP anything.

If you're going to be dictatorial about how people should use the
net, recommend something realistic like posting to comp.binaries.*,
alt.sources, or comp.sources.misc and posting an announcement in
the relevant groups.

On the other hand, consider a product that still requires a lot of
mechanical assembly, like a kilowatt amplifier. You can still save
a lot of labor cost by building one of these yourself, either in
kit form, or totally homebrew.

Actually you press some buttons and turn the radio on. This enables
out of band receive. It is not neccessary to hold any keys down while
receiving. And yes it will demodulate AM aircraft fine. Incedently,
SF bay approach (135.65) comes in fine even though "U" is displayed in
the memory display. There are mods to do out of band transmit; again
key press and turn power on; no diodes to cut. However, transmit in AM mode?
Don't think so.

>Ron Todd, K3FR

When I worked for a DoD contractor I saw a similar setup used by the US Army.
Grounding was real bad in places like the Central Washington desert and
they came up with a scheme of using 15 or so short 10 inch copper stakes
that were T shaped. The top of the T was to allow them to be driven in with
your foot. They were spaced about 3 feet apart and used tined copper
wire to connect them together. The stakes just had a hole in the top for
the wire to pass though. No solder. I suppose the theory was that when
driven into the ground the wire would be pressed against the copper stake.
Supposedly it worked well. Note that this was the result of an extensive
and no doubt expensive investigation into proper grounding. (Actually
probably not very expensive by military standards as the project was
very "skunk works".)

1102. Learning code problem

Newsgroup: rec.ham-radio
Date: 1990-09-12 19:35:12 UTC
From: megabyte@chinet.chi.il.us
Message-ID: <1990Sep12.193512.18069@chinet.chi.il.us>
Source record: 8562

I'm having a problem learning the code for my novice ticket. I'm using tapes and when I miss a letter or two, the tapes advise me to re-wind and do those sections over again. The problem is, I then know what that says! It's not doing me much good as I already know what all the letters will be. Now certainly, just hearing the DiDah patterns and writing the letter, even when you know what the letters will be, is helping, but I wonder if there is another way to get pratice.. on just those letters that are goofing me?

Would that I had a IBM PC or C-64 computer, I understand there are programs, but I have an Amiga.

Any tips on learning code and getting pratice on just the letters I know? I tried tunning into the ARRL code pratice and the novice bands, but as I only know A,C,E,H,I,M,N,O,P,R,S, and T so far, its tough.

Six weeks to exam time!

Sb: Another two-wire CPO

Here's another way to have a two-wire code-practice system, but without
the "sidetone" buzzer (saves battery power).

the "sidetone" buzzer (saves battery) power>

1. Wire the key in series with a battery, negative side of the battery
to the key.

2. Wire a diode in series with a buzzer, cathode to the buzzer.

3. Parallel the key/battery combo across the buzzer/diode combo.

4. Repeat the above steps for the "other" end circuit, except reverse
the polarity of both the battery and the diode.

5. Now connect a wire pair between the ends of the paralleled combos.

NOTE: with this circuit, be sure to NOT close both keys at the same time
because it will connect both batteries in a series short-circuit.
When one key is closed, the diode on that end is reverse-biased and so no
current will flow thru that buzzer. However, the diode on the opposite
end will be forward-biased, causing the buzzer to sound.

Yes. I don't remember them, but I'm sure they're listed in QST or somewhere
in the ARRL voluntary bandplans.

THE ARRL LETTER - Volume 9, Number 17 - August 24, 1990 - PART 1 OF 3

Nets Get More Time to Resolve Disputes

The Federal Communications Commission has granted several nets operating on the 20-meter band more time to resolve their on-going disputes.

The FCC entered the 20-meter dispute late last year when it sent letters to 19 net and bulletin station managers (including W1AW, which is not involved). A second FCC letter to nine of the managers asked them to come up with a plan to resolve the disputes, which have been occurring for some time.

Responses from five of the managers were received by the July 1 deadline.

FCC's Robert H. McNamara, chief of the Commission's Special Services Branch, wrote on August 9:

"The Commission has received five individual plans addressing the underlying causes of unproductive on-the-air disputes that were taking place on the 20 meter amateur service band. It is obvious that the amateur community desires that the disputes be resolved amicably and that potentially restrictive rule making be avoided. It appears, moreover, that there has been progress in resolving the disputes.

"The plans recommend" the FCC letter continues "that the amateur community be allowed to continue addressing this problem internally. Interest in this approach as a model for future dispute resolution in the amateur community has also been expressed by other observers.

"Because rule making could limit the flexibility that amateur operators now enjoy, it is important that you succeed in this activity. I believe that the requested extension of time is warranted. Correspondence from other amateur service licensees indicates that they, too, are interested in assisting with the development of the amateur community's plan. Therefore, I am extending until February 1, 1991, the date for you and other interested amateur service licensees to develop the joint plan."

The League maintains that the disputes--involving three sticking points--are resolvable by enforcement of existing FCC regulations:

* One-way broadcasts, if they go beyond accepted norms for such transmissions on the amateur bands, are illegal;

* Third-party traffic, which is allowed *only* when a formal agreement exists between countries;

* Malicious interference, which is illegal always.

THREATS BRING AMATEUR'S ARREST

On August 2, FBI agents assisted by FCC investigators arrested Anthony V. Marcantonio, KA2ZGE, of Queens, NY, and seized 20 pieces of his radio transmitting equipment. FCC earlier had responded to complaints that Marcantonio was "interfering with amateur radio communications by transmitting unidentified, disruptive signals on the two-meter amateur radio band," according to the FCC.

"On July 27, FCC investigators, using direction finding equipment, traced the signal to the Marcantonio home," FCC said. "The investigators discussed the situation with a family member who then shut the transmitter off. The transmissions resumed that evening and continued into the next day." It was then, according to FCC, that Marcantonio made death threats over the radio against an FCC investigator.

Marcantonio was charged with making threats by radio, a felony carrying a penalty of up to five years in prison, a $250,000 fine, or both. A federal judge set Marcantonio's bond at $50,000 following a hearing. (FCC public notice, Aug. 14, 1990.)

CANCER CLUSTER DISCOUNTED

The state of Connecticut has told residents of the town of Guilford they have ruled out that there is a higher than expected rate of cancer in the town. The state conducted the survey after an article in *The New Yorker* last month suggested that a large number of cancers in a particular neighborhood were related to a nearby Connecticut Light and Power substation (*Letter*, July 13).

"Given the findings," said Sandy Geschwind, an epidemiologist with the Connecticut Department of Health Services, "it appears very unlikely that EMFS (electromagnetic forces) are related to the meningiomas on Meadow Street" (in Guilford).

The state's conclusion was based in large part on the fact that abnormal numbers of cancers were not found around other electrical substations.

THE ARRL LETTER - Volume 9, Number 17 - August 24, 1990 - PART 2 OF 3

FOUNDATION NAMES SCHOLARSHIP WINNERS

On Aug. 9 the Foundation for Amateur Radio announced the 1990 winners of the 33 scholarships it administers. They are:

John W. Gore Memorial Scholarship to Stuart Rosner, WU4L, Vienna, VA;

Richard G. Chichester Memorial Scholarship to Michael King, KA8NAJ, Canton, OH;

Edwin S. Van Deusen Memorial Scholarship to Martin Gruen, KA2VLD, Runnemede, NJ;

QCWA Memorial Scholarships to William T. Baggett, AA5DF, New Braunfels, TX; Thomas W. Brown, KA2UGQ, Berkeley Heights, NJ; Victoria L. Gruen, KA2VHR, Runnemede, NJ; and Paul W. Hoffman, NK3M, Sinking Spring, PA;

QCWA Leo Meyerson Family Living Scholarship to Robert M. Popella, KA3HIE, Tidioute, PA;

QCWA Robert S. Cresap Memorial Scholarship to Jason G. Lovett, N1EJD, Kennebunk, ME;

QCWA Cresson F. Donbar Scholarship to Heather L. Ludtke, KD0RU, Glenwood Springs, CO;

Radio Club of America Scholarships to Douglas Claprood, KA2KWB, Mt. Morris, NY; Timothy Potocki, N3CZV, Bradfordwoods, PA; and Jonathan Vidal, NY3Z, Erie, PA;

Edmund B. Redington Memorial Scholarship to Richard T. De La Hunt, KA0LEE, Park Rapids, MN;

Young Ladies' Radio League Scholarship to Melissa Benish, N3FAC, Pittston, PA;

Amateur Radio News Service Scholarships to Jennifer Doerrie, KA5WMJ, Booker, TX; and Paul C. Yoder, KA3MUD, Bridgeport, PA;

Columbia Amateur Radio Association Scholarship to Kurt W. Rupprecht, N3EOI, Salisbury, MD;

Baltimore Amateur Radio Club Scholarships to Barry Bell, KA3PRE, Reisterstown, MD; Andrew S. Faiola, N3GLA, Silver Spring, MD; and David S. Katz, N3DKV, Bowie, MD;

Dade Radio Club Tropical Hamboree Scholarships to Aaron A. Algiere, KC4NGA, Gainesville, FL; and Nathaniel Tarbox, KC4AOI, Jacksonville Beach, FL;

Rose Ellen Bills Memorial Scholarship to Douglas M. Benish, N3CXB, Pittston, PA;

Victor C. Clark Memorial Scholarship, Sponsored by the Vienna Wireless Society, to William T. Free, KC3YO, Fairfax, VA;

Frederick Amateur Radio Club Scholarship to Amos D. Faux-Burhans, KS3O, Thurmont, MD;

10-10 International Net Scholarships to Mark Horwath, KA1SPU, Derry, NH; and Nathan S. Willingham, KA0UFO, Bevier, MO;

WARAC Memorial Scholarships, sponsored by the West Allis (WI) Radio Amateur Club, to Douglas Kleemann, KA9LWN, Shawano, WI; Chad Kurszewski, WE9V, Greenfield, WI; and Martin Van Der Burgt, KA9MSR, Kaukauna, WI;

Kevin Barry Perdue Memorial Scholarship, sponsored by Kay (KC3LM) and Carter (KD3AO) Craigie, to Matthew M. Harbur, KB2GHW, Woodstock, NY;

Karl R. Medrow Memorial Scholarship, sponsored by the Goddard Amateur Radio Club, to Lesley D. Walker, N4FTJ, Cullman, AL.

These scholarships were open to all radio amateurs meeting the qualifications and residence requirements of the various sponsors. The Foundation is a non-profit organization representing fifty clubs in Maryland, the District of Columbia and Northern Virginia. It is devoted exclusively to the scientific, literary and educational pursuits that advance the purpose of the Amateur Radio Service.

420 MHZ RESTRICTIONS EMPHASIZED

Amateurs in New Mexico and western Texas using the 420-450 MHz band have been asked by the Department of Defense to step up efforts to avoid interference to the White Sands Missile Range. Amateurs in the area already are restricted to 50 watts PEP, on a secondary, non-interference basis, within the White Sands Restricted Area.

DOD area frequency coordinator Stanley F. Greene, in an Aug. 6 letter to selected amateurs, said that "additional coordination appears necessary to overcome conflicts in this band. In the 420-430 portion of this band, increased amateur repeater control activity and the possibility of mobile operations, are a concern as sources of interference to White Sands Missile Range operations. Amateur mobile and repeater operations in the 430-450 portion, are a continuing concern to Fort Bliss range operations.

"The US Air Force," the letter continued, "...recently asked the FCC to add an additional rule for the White Sands Restricted Area. This would require amateur operators to coordinate any operations in the 420-430 MHz band with the White Sands DOD AFC before operating there. We understand that this request has been approved by the FCC, in principle, and will be incorporated in the future."

The letter asks "that mobile or repeater operations in the 420-430 MHz band not be performed in the White Sands Restricted Area unless first coordinated with this office. The intent of the restrictions and coordination requests placed on amateurs in this area is to prevent interference on some frequencies while allowing your general use of the band to continue. Your cooperation in this effort to prevent radio interference to area DOD missions is appreciated."

THE ARRL LETTER - Volume 9, Number 17 - August 24, 1990 - PART 3 OF 3

BRIEFS

* AMSAT has announced that the 1990 AMSAT Space Symposium will be held at NASA's Johnson Space Center Visitor's Center in Houston on Oct. 19-21, and will be hosted by the Johnson Space Center Amateur Radio Club (W5RRR). The symposium will feature talks on amateur space communications and related subjects, including the new Microsats. Additional talks are tentatively scheduled on the SAREX Shuttle flight STS-35. For more information write AMSAT or phone them at 301-589-6062.

* October *QST* will announce new awards for November Sweepstakes participants. Make 100 or more contacts on either CW 'or 'phone, send two dollars and an SASE along with your SS entry, and you'll get a special pin in return. The pins will be dated each year, making them unique.

The SS announcement also will contain new specified band segments for slow speed CW (up to 13 wpm).

* Urban search and rescue operations will be featured on a nationwide teleconference to air Aug. 29 over the Federal Emergency Management Agency's (FEMA) Emergency Education Network (EENET). The telecast, from 11 a.m. to 3:30 p.m. EDT, will focus on earthquakes. EENET can be reached with a C-band antenna or satellite dish. Satellite information is: Spacenet I, Transponder 2, Channel 3, downlink frequency 3760 MHz, audio frequency 6.2/6.8 MHz. Spacenet I is located over the equator at 120 degrees west. For more information call EENET at 301-447-1068.

* On July 26 the U.S. Department of State announced that the United States government has recognized the Republic of Yemen, formed by the union of the former Yemen Arab Republic and the People's Democratic Republic of Yemen. The names to be used for this nation are Yemen (short form) and Republic of Yemem (long). ARRL's DXCC branch has asked that NO QSLs be submitted for either the former or current Yemen(s) until DXCC status of the new country is determined.

* The FCC is allowing little time for comments on its proposal (PR Docket 90-356) to relax Morse testing of disabled persons (*Letter,* Aug. 10, 1990). Deadline for comments is September 24 and for reply comments Oct. 9. The notice says "Extensions of time are not contemplated."

* As of the August 10 deadline, nominating petitions for the ARRL board of directors received (and still subject to certification of eligibility, etc.) include:

Central Division: director, W9PRN; vice director, K9EN, W9CJW, K9KM; Hudson: director, WB2EZG, WA2DHF; vice director, WB2VUK; New England: director, K1KI; vice director, WB1BRE; Northwestern: director, W7QGP, W7QMU; vice director, NM7N; Roanoke: director, N4MM; vice director, WD4HLZ; Rocky Mountain: director, AG0X; vice director, K0PGM, WB5YYX; Southwestern: director, WA6WZO; vice director, N6NB; West Gulf: director, W5SOQ, N5TC; vice director, KV5X.

In the Central division, Robert H. Lieberman, WA9JWN, was nominated for director but was found ineligible because of a lapse in membership.

* Oleg goes home! On Aug. 15 Oleg Murugov, UA4FAY, injured in a May auto accident, finally went home from the hospital in Ryazan, RFSFR. Murugov, recovering from severe injuries, has been aided by effort of a number of American amateurs (see the *Letter*, June 15 and 29, 1990). Of gravest concern was brain injury; Murugov initially was in a coma. Soviet physicians received advice and encouragement from several American medical specialists during his first few weeks of hospitalization.

(Oleg) "is much stronger and can shake hands," said his friend Igor, of club station UZ4FWO, "although the right side is still partially paralyzed. He walks with the help of one person and can feed himself with his left hand."

sawyer@twg.com (Bruce B. Sawyer), in an admittedly biassed and inflammatory posting (G'day Bruce!) suggests:

Let me get this straight.
(a) You and AA5ME heard it for many hours in the afternoon.
(b) Nobody else but Rick did because they are too busy with {set of worthless pursuits}.
Hmmmm. Let me suggest one other possible explanation for the lack of response.

--> Contrary to the gospel of KA9Q, there do exist cw ops (usually called "olde fartes" in these parts) who have not yet racked up the advanced number of years needed to gain admission to the society of OLDE FARTES and thereby partake of the benefits to which they are and should be entitled by virtue of having made this country great, etc., etc.: Social Security. In other words, we work.

What, Saturday afternoons and Sunday afternoons every weekend? You never get on the air ever? And nor does anyone else on the net? Gad, what a *senseless* waste of human life!

Admittedly I'm just a perfessa and so I can stop by the club shack on the way to or from classes, and AA5ME is a lazy time-wasting gynaecologist who can take time off from doing baby things to work DX, but I did mention that this stuff was loud and clear during the (phone) contest at the weekend, which means Sat and Sun to most people.

And I'm not a Real Olde Pharte, I'm a Middle-Aged Pharte at least two solar cycles away from collecting Social Security. And I can't claim to have made this country great [sic] cos I'm not even an Amurrikan. I would just like to be able to use the frequencies that the Great and Glorious FCC gives us.

Flames welcome (they're more interesting than a lot of the postings on this net!), but best directed at 45 deg to whoever is making these naughty noises in the amachure bands.

When aircraft started using VHF radios, they were using
already AM on the HF Aero bands so it was the obvious choice.
Even hams were using AM on VHF at that time. VHF/FM came a
few years later. Much later all HF aeronautical traffic switched
to SSB while VHF stayed to AM. There are still some AM aero voice
circuits in operation on HF.

1112. Getting a FT-811 on 420 Mhz.

Newsgroup: rec.ham-radio
Date: 1990-09-13 01:55:34 UTC
From: philb@techbook.com
Message-ID: <1990Sep13.015534.20396@techbook.com>
Source record: 8604

Hi. I just got a FT-811 Uhf handheld that I want to use to debug
420 Mhz full duplex links for a repeater I'm building. I have the
mod that is supposted to do this but it does not work properly.
I can xmit on 420 but the receiver is completely numb on all
frequencies! Backing out the mod restores it back to normal.
I appear to possibly have a newer version of this radio as the
serial number looks like it might have been turned (mine is
9N120004). The mod I used removed jumbers from postions 2 and 4.
A new jumper was added to position 3 making the only jumpers
connected to positions 3 and 7.

Can anyone help me with this? I couldn't care less about rx or
tx outside the ham bands just 420 to 450 Mhz is all I need.

HELP!!!!

>How do you couple the mic/earphone to the line to get it to respond
>to ringing current? Just take the series connection and put it
>across the line? Any idea what the REN would be?

>Tad Cook

I perhaps erroneously assumed that most hams had, when young, played
with telephone parts and improvised their own neighborhood systems.
Connecting mikes, earphones and batteries in series is a fun and
educational cub-scout project. Add an amplifier, and it's a bugging
device! :-) DON'T connect it to Ma Bell-- It works, but the outgoing
audio is very weak because of impedance mismatch.

The abovementioned audio-feedback oscillator might work as a "real"
phone ringer if capacitively coupled, but TPC (The Phone Co. (tm)) et
al would surely disapprove.

1114. Swan 500 C & 10 meter antennae

Newsgroup: rec.ham-radio
Date: 1990-09-13 03:48:46 UTC
From: gp15@cunixf.cc.columbia.edu
Message-ID: <1990Sep13.034846.30700@cunixf.cc.columbia.edu>
Source record: 8597

A couple of years ago I bought a Swan 500C at a hamfest. It has been sitting on my desk since then, unused due to my lack of low band antennae, my fear of blowing it up (I've never tuned up an HF rig) and my abundant stock of other distractions.

Having never been on a band below 144 MHz, I'd now like to give the low bands a try now.. or should I say "the low band" I'm a tech and hence am restricted to SSB on 10 meters for now.

Questions:
1) I need to buy or build (probably build as I have to skills or facilitites for metal work.) a 10 meter antenna. I live in an apartment house, and since my landlord has overlooked my 2mtr & 440 vertical antennas mounted on TV masts on the roof, I figure that another vertical would probably be the safest thing to try. I considered a dipole, but don't want to experiment with seeing what sort of reaction I would get to an antnna involving wires extended over the roof. The only commercial antenna I've noted which seems appropriate is the 10 meter Ringo. Opinions about that antenna.. or suggestions of others? I should also mention that I am on a rather tight budget. I left the real world last year to become the proverbial "poor grad student" and as such will not be able to implement suggestions involving $200 arrays.

2) I could use some instructions on how to tune up my Swan 500C and B&W VS300A antenna tuner without causing damage to the rig or myself!

In article <18763@ucsd.Edu>, brian@ucsd.Edu (Brian Kantor) writes:
>
> We need some way to distribute ham programs, yes, but this isn't the way.

I have often offered various bits of ham software on this forum. I usually offer the software in exchange for a disc and SASE. I have had very few takers. Sometimes some cocky soul upon seeing my offer of disc copying asks if he can ftp it from somewhere. When I reply that I do not have the facilities to upload, but if they send me an SASE etc, they can then do the community a favour and upload to the host of their choice I always hear nothing more. I wonder why? Did they really need the software or were they just bored and wanted to add more useless bits to the pile.

Anyhow, I have always considered that mailing disks a pretty efficient way of distributing software if you are not in a tearing hurry. If you are in a tearing hurry, there are various BBS that carry all sorts of ham stuff. W3FFV and N8EMR are two who are correspondents to this forum and have extensive files.

If you want various ham and packet software by mail, TAPR has a pretty good selection for silly rates like $2.00 per disk. For Satellite users, AMSAT has lotsa stuff. Of course the AMSAT stuff tends to be theirs alone so you have to pay more for it, but it is value for money and pays for more stuff in the heavens.

There is I believe an AMSAT BBS, besides the Celestial BBS that Kelso seems to be the master of.

So what this tiresome ramble is heading to is that fact that there are tons of places and ways to get ham software. I haven't even touched on the person to person frisbee-lan. If you have something wonderful for the community, many BBS would be happy to carry it.

This is not a flame, just mumbling about software distribution.

Yeh, I've thought about this kind of selective call scheme before,
but I believe it is *strictly speaking* illegal. The question that
must be answered in such a case is "who or what is controlling
the station?" Since nobody is presumably home all the time, there
is no control operator there. The next possibility is that the
station is under "automatic control" but this is allowed only for
repeater stations. (I suppose there is some contrived way to define
the station as a repeater???) Finally, the person making the selective
call could be the controlling station, implying an "auxiliary control
link" which would be illegal on 2M (but legit on 440).

It wouldn't work at audible baud rates, but back in the 45.5 baud Baudot days in Air Force MARS, there was a repeater at Hanscom AFB, MA, which did both simulataneously. RATT (as the military call it) had a separate input frequency and produced direct FSK of the repeater carrier. To voice users, it sounded like a dead carrier and each type of user operated without QRM from the other.

Because even 300 baud packet would be audible, that old system wouldn't work but maybe some more sophisticated form of multiplex would.

1120. Re: Heatkit to be sold?

Newsgroup: rec.ham-radio
Date: 1990-09-13 05:59:35 UTC
From: rrw@naucse.cse.nau.edu
Message-ID: <2523@naucse.cse.nau.edu>
Source record: 8599

Back last fall, I talked with a rep from Bull and asked about
Heathkit. What follows is the gist of our conversation.
I DON'T KNOW IF ANY OF THIS IS TRUE ... TAKE WITH GRAIN OF SALT.

He said that Zenith had acquired Heathkit as an "easy" way of
getting into the computer business, since it had previously bee
n almost entirely into consumer electronics (tv's, etc). Course
this turned out not to be such a good move since Z never captured
a major share of the market. After HK was bought by Bull, the word
was that the divison was not going to be supported at anything
beyond a minimum level. The reason for this was that a study
had been done about 10 years ago which projected that in the
future (ie, now), work would have become so automated that
leisure time would have increased by 40%. Thus the kit market
was expected to boom. However, this study hadn't taken new
technology developments into account (difficult predicting the
future, especially in electronics), and hadn't realized the
impact of VCR's and PC's. What has actually happened is that
leisure time has DECREASED from what it was 10 - 15 years ago,
so no one has time to build kits anymore. Thus the direction
of Heathkit was going to be away from "hobby" applications and
towards education/training. And in fact, I just got a Heathkit
educational division catalog yesterday.

I too am very nostalgic for Heathkit. My first amateur rig
was an HW-16 code only rig. Was a big deal when the regs
changed from being rockbound to being able to use a VFO. I
immediately bought the VFO (was it $75?), and had great fun
since I COULD ACTUALLY TRANSMIT ON THE SAME FREQ AS THE OTHER
GUY WAS SENDING! WOW!

I also built (about 1968) the Heathkit BOONIE BIKE, which was,
believe it or not, a kit motorcycle. The major claim to fame
was a rear tire that was about 8 inches wide (might have been
a foot) which supposedly acted as a flotation device so you
could zip through mud and so forth where standard tires would
sink in. This was somewhat correct. The bike would stand upright
on it's (wide back) tires without even a kickstand. It had
a centrufigal clutch which gave a lot of trouble, though. B & S
engine, also, as I remember.

Anyway, I hope that Heathkit is picked up by a company that will
find a way to keep the company going and make a profit. I still
do buy stuff from them, although not usually not kits. Most recently I bought
one of their "house sitters", a unit which monitors temperature,

power, etc and dials you up if parameters go out of bound. I use
it at a cabin which I only get to occasionally.

Anyone else have old Heathkit nostalgia?

I've heard and believe that if you study a "character <-> pattern" list
you will never get very fast at morse. But I still wanted one. So I
created a "character <-> sound" list instead. DO NOT memorize which
letter has a "dit" and which has a "dah", memorize the sound of the
letters. Listen to those tapes! Don't use a list.

Just for fun, in a permutation of 4 bits you get 30 possible patterns.
As there are only 26 letters in the alphabet, what four patterns are
never used?

Any noise bridge circuit will work, except that you don't need variable bridge
legs. Select the values that balance the bridge at 50 + 0j.

Is there any advantage over putting the program in the already existing
appropriate group and announcing it in rec.ham-radio?

Here are some reasons not to have a ham-binary group:

Binary for what computer? the first thing we would have to do
is split it into ham.binary.amiga, .cpm, .c64, .ibm, abi-sparc,
.abi-moto, .abi-intel, .mac, etc etc etc

Hams like to play with things and adapt them, right? give us
source!

Having ham programs show up occasionally in the computer groups
helps give the hobby more exposure. XXX computer owner says to
himself "Looks like a lot of people use XXX for ham radio....
I should check it out."

Computer modelling of HF antennas is certainly not an exact science.
Agreement within 1 db by prediction programs is certainly better than
any agreement you would get by actually measuring the antenna at real
sites.

Language chauvinist! :-)
If a program gives results in a reasonable amount of time, and the algorithm
is properly implemented, who cares what language was used.

>

If I were an antenna manufacturer, I wouldn't depend on a computer simulation
to design my antennas. Real range data is much more valuable.

> GUY WAS SENDING! WOW!

I have a question: If novices were required to use crystals to generate the xmit freq, and assuming that you don't have a really big selection of frequencys (i.e. crystals), then how would you go about answering a CQ? If you are not on the same freq, then how would you expect the other guy to hear you? Keep answering, and wait for the other guy to eventually tune his radio and stumble on your answer? Seems that would take a long time before you connect. Or was there an agreed on contact frequency, that everyone would buy crystals for? Then you tell each other what freqs you have xtals for, and move there? Is 3.579545Mhz in the novice band? (I don't have the allocations memorized or handy). That freq would be a very common crystal, as it is the color TV color info subcarrier. If it is, then that might be a contact freq.

It is important to stop the discharge of a battery pack when its
terminal voltage reaches about 1 V per cell, to prevent any given
internal cell from going to zero volts. The damage to a cell comes
when it becomes reverse biased and is reverse charged by the rest of
the pack. 1 or 1.1 V is rather arbitrary, what we are looking for is
the voltage below which very little charge still remains on any cell
in the battery. Once any one cell reaches that voltage it is extermly
easy for the stronger cells in the pack to rev bias that weak cell.

Ah .. the critical point.. if all the cells are perfectly matched this is
not a problem they all die simultainiously.

If however you as many hamOAs often do..you have replaced a bad cell or 2
or have made up a pack of surplus cells, who knows when the first weak
cell will die.

There is no danger in discharging an individual nicad cell to zero volts,
regardless of the load as long as we stop there. If we continue to force
current thru the cell it will reverse bias and liklly short. The whole
"trick" is in knowing when to stop if you can only measure the battery not
cell voltages.

For commercial batteries 1 V per cell seems to be a good rule of thumb.
A factory made battery pack will be made from cells of the same lot which
are reasonably closely matched.

For large expensive or very critical application measure every cell and
stop when the voltage approaches zero on any one.!

Because your HT can't sence the right voltage to stop discharging the
battery mean you will have a hard time protecting the big battery!
The mfgr set the right cut out V for the small battery. In application
where multiple voltage batteries are allowed the function is best built
into the battery.

Then again for commercial battery packs this only starts to be a problem as
they get old, when 1 or more cells start losing capacity. Just about the
time the manufactuer wants you to buy a new battery!

Tried to email twice; I think it should have gone; Oh well I'll post
so OE1CDS can get some of your comments on my comments. (Time to
debug mail again.)

In article <246@eliza.edvvie.at> OE1CDS writes:
>Has anyone experience with the ICOM IC-735? I am new lis and want to
>buy a shortwave transceiver. Other alternatives would be the FT-757, or

>tnx es 73
>oe1cds
>--
>This does not reflect the | Christian Dworak
>opinions of my employer. | USENET: dworak@edvvie.at
>I am busy enough by talking |
>about my own ... | EDVG Vienna/Europe - Tel (+43 222) 59907 238

I recently bought a TS-440/S with the auto antenna tuner. I also considered
the ICOM IC-735 and the FT-757. I thought the 440 was better than those
two. I really wanted to get either the FT-757 or one of the ICOMs (735 or
725/726) but felt that the kenwood had more features:

100 memories (I use memories alot; I've already used 10 which is the alotment
you get on the yaesu);

RIT/XIT display (the others have RIT but no display;
I didn't like the way ICOMs RIT worked, same goes for the CLARifier on
the yaesu); (Do the ICOMS have SPLIT operation? Does the RIT
vary more than 1 or 1.5 khz? RIT would be useful for SPLIT if
it varies enough. The 440 does SPLIT using 2 vfos. Its not possible
to work SPLIT [with freqs more that 1.2 khz apart] just using RIT with
the 440.)

The 735's controls for mic gain/VOX control were under the little front
panel door which I found difficult to get too;

However, the 440 has the vox controls on the rear, which is not good,
it is o.k. because I don't use VOX that much;

I wanted 10 hz freq readout which you get on the 440 after snipping a diode;

I think ICOM has this but was told that the yaesu doesn't;

When changing modes on the yaesu you have to cycle through
usb->lsb->cw->am->fm->back to usb....which means if you want to go from
cw to usb you have to go through fm which generates alot of noise in the
speaker;

The tuning feel of the yaesu and the ICOM is better than the kenwood; sometimes I think the kenwood does not have enough revolutions per kilohertz; what I mean is that for a very small change in the dial you get a change of about 200 to 300 khz. I know of no way to change this. On the Icom and yaesu when you turn the dial slowly it only changes about 50 to 100 khz.

With the 440 you can get a 1.8 khz wide SSB filter which I find essential for working 20 meters. I don't think this is available on yaesu or the ICOM 735/725/726.

The kenwood has AFSK ports which I use for RTTY, AMTOR, and PACKET. I think that you have to use the microphone jack on the ICOM; the yaesu may have an AFSK port, I am not sure.

Of course the 440 is about US$ 100 more than the ICOM or yaesu. The auto antenna tuner is another $200.

I had a small problem with my 440: It made a very faint clicking noise when turning the main tuning knob. It turned out that the optical encoder had a small mechanical problem with it. Kenwood is sending me a new optical encoder at no charge, but in the meantime I was able to fix the instlled one.

There is a new radio from ten-tec called the Delta-II. It is a 100 watt (maybe 150 or 200 watts, I don't recall) HF transceiver with 100khz to 30 mhz receive. I don't know what the price is but I think it should be around US$1000. The nice feature about it is that it has a countinously variable width filter. I think this is a good feature in a $1000 radio. I wish I had it in the kenwood. The Delta-II is supposed to be available in november. If the price was right and available today, I might get one.

Maybe this is the Iraqi radar refered to in Wednesday's Page 1A USA Today article about the CIA's prediction of imminent Iraqi military action in late July.

Aha! Please tell us more, Jim (e-mail if you think everyone else reads USA Today). If it's the YI's radar, then they certainly won't turn it off for our contests :-) [Perhaps they would move it to 14313 though]

Is everybody ready for this? This morning on the commute to work, I listened to another operator complaining that his PLL LOCK indicator on his 2M base rig kept going on.

To mean that means a problem, but this guy is 'sure' it is to prevent unauthorized transmissions outside of the HAM bands. He is going to attempt to go in and disable this circuit.

To me that is like "Hey Gomer, I have this oil light on my dash that keeps going on! Ok, BOB, No problem, we'll just unhook the light!"

Am I missing something here???

I would have joined the roundtable and asked, but this guy already hates my guts. I seem to have disagreed with him at some time! It's all but made me stay off the club repeater I used to belong to, what with his assinine comments, unknown jamming, and even a "No Lids" sing with my call written on it posted at the club sponsered field-day setup. (This '*' is a club VP, and ran the field day setup. If you weren't one of his 'buddies' you couldn't even get into the trailer at field day!)

Maybe it's best to just let the '*' screw up his radio! I mean, he knows all! He's an 'extra'!

Actually, it's simpler than that. Safety. If you have two AM radios on
the same frequency, they'll garble each other. FM is more likely to
simply have one station override the other and make it disappear. If a
plane is in trouble and has a weakened radio transmission, it's
possible that if they were using FM nobody would hear them, but AM
they'd cause enough interference that the ground would know to clear
the channel and listen for them.

I don't remember this specific technique, but I bet that if someone has a copy of "Hints and Kinks" from the 1950's it'll probably be in there! I have a copy somewhere in the attic, but I don't believe I can readily find it.

Some of the construction techniques suggested in that book are truly bizarre by today's standards. It is also interesting to note that during the 1950's only three or four amateurs were responsible for most of the "hints and kinks" which appeared in QST and in a similar fashion appeared in Popular Electronics or Radio-Electronics. At the time, I often wondered if that was their sole purpose in life. :-)

How about this for an example: Turn an old toothbrush into a dial cord stringing tool by cutting off the bristles and filing down the end? I'm *serious*!

One name even comes to mind, who was probably the No. 1 originator of Hints and Kinks material: Art Trauffer. Does that name (or something like it) sound familiar to anyone?

> OK - LET'S MAKE A rec.ham-radio.binaries !!

How about rec.ham-radio.software -- I think that would be more appropriate, because it would encompass sources, as well. I already have a nice hand-full of things to post, including a moonphase prediction program, the famous MORSE 2.x tutor, and SEESAT - two of those are C sources, one is a binary.

I *SUPPOSE* that rec.radio.software would be acceptable, too, because much of this stuff is of interest to SWL'ers, too -- my problem with this is that it makes a lot of things much more convenient to have a single rec.ham-radio heirarchy, and so the best option would be to move rec.ham-radio into rec.radio.ham (or something like that).

My $0.02 Hope you got my money's worth :-)

Best 73's,

Chris/WZ2B

1147. My Experience with the AEA Isoloop. . .

Newsgroup: rec.ham-radio
Date: 1990-09-13 21:34:12 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Sep13.213412.9674@midway.uchicago.edu>
Source record: 8593

For the past few months I've been reading ham-radio in the hope that soneone out there could give us some info on this AEA ISOLOOP antenna. But, no luck. I've heard people on 2m here in Chicago discussing the Isoloop - of course, no one had one but everyone wondered how/if it worked. I've heard people say flat out - "It can't work".

Well, I bought one and have been using it for a week or so. I should say that I was "forced" to buy one - I'm an apt. dweller, and, having experimeted with various things found that I probably didn't have a choice. My 45 ft multi-band dipole worked ok - but was aesthetically displeasing.

Parts is Parts. . .

The Isoloop is made of aluminum and comes in two pieces which need to be joined together via some connectors. That's all there was too it. Early units did NOT come with any control cable (the review in CQ mentions this). My box came complete with 50ft of control cable, the control box and a small wall-plug power supply (only included in USA versions). Basically, its complete including hardware for mounting on a mast either in the vertical or horizontal direction. All one needs to supply are "externals" such as coax, a mast for mounting and possibly a tripod. I already had all of the above.

Its too small... it CANT work. . .

Does it work? Well, amazingly it does. How well? Read the review in the recent issue of 73 comparing the Isoloop to the R5 and a full-size attic dipole. All I can offer is my qualitative experience (after a week of use).

First, I prefer to use the Isoloop in the vertical rather than horizontal position. The horizontal position gives an omnidirectional pattern. The vertical gives a directive pattern with the gain of a dipole. I have my Isoloop mounted vertically with the plane of the loop pointing East-West. This produces nulls in the North-South direction. One afternoon I worked a number of stations on 10m mostly in California (from Chicago) using both FM (40 watts) and SSB (100 watts) and got good signal reports on all contacts. The propagation conditions were just average and it was mid afternoon. A few days latter in the evening I worked most states on the West-East line from Chicago on 10m and 20m. All my contacts have been stateside so far. (1 week)

Beggars can't be choosers. . .

Tuning this thing via the stepper motor is another matter. In switching bands (say, 10m-20m) it takes about 20 seconds to get to the general vicinity of resonance. Past this, at least for transmitting, it takes another 10 sec or so to fine tune to minimum SWR. That may not sound like alot but its not

exactly "tune and talk" as if you had a R5 or tuned diople. But, it will get you through the night.

Use. . . and observations thereby. . .

All contacts mentioned above was with the Isoloop indoors, in a wood frame house, on the 3rd floor about 35ft up from mother earth. Even with the Isoloop not in "free space" (I have it in the corner of a room) I can get a 1.4:1 SWR or less on almost all bands (14Mhz-29Mhz). I even tried with the Isoloop in a closet - that works too. I'm working on passing this thing off as an "art object" to my non-ham friends. (A bit easier with my 2m/440 discone)

A better place for the Isoloop would be hanging it out a window. Its small size fits easily through a window. Its very light and support is not a problem. Mounting brackets on the Isoloop would allow both horix. or vert. mounting. I'll try this in a week or so.

I like the fact that this antenna is directive. And, indoors on a tripod I can easily turn it to whatever direction to get the best reception/signal-reports. This is something you couldn't do with a diople. There is no directivity with a R5 so running barefoot as I do (100 watts) this gain/ directivity is an advantage. An obvious "next step" would be to add a remote antenna rotor to the Isoloop/tripod. That would be a great.

Some improvements I'd like to see. . .

A few things could make this thing easier to use. First, as regards "accessories" that could be provided.... how about automatic tuning based on the same principles used by automatic antenna tuners internal to some transcievers (TS-440). Since the motor control circuit is already there is shouldn't be too hard to hack additional electronics to monitor SWR on low power transmit and tune accordingly. If I can't have that... how about just a simple feedback mechanism to tell me where the position of the tuning capacitor is. Once I have the Isoloop in a "fixed" position I would assume that resonance for a particular freq. would always occur at the same place. Why not tell me where that is via some digital readout so I don't have to keep hunting this down every time I want to go there?

Conclusions. . .

I like the Isoloop alot. In fact, I think its the *only* solution to the problem of not being able to put up a beam, full-size dipoles or vertical for HF work. This problem is probably faced by all apt dwellers to some extent. Price? AES has it for $349 mail order and no tax if you are outside Wisc. I've seen it for just under $300 in QST - but they might be earlier units without the control cables - check if you're going to buy one.

I will continue to experiment with my Isoloop. I wish QST would do a review of this thing. The CQ review was really really poor in quality; the 73 review was a bit better. I think QST could do a good job based on the quality and depth I've seen in their product reviews.

Your guideline sounds about right. Better safe than sorry! In addition the mail to many third world countries is very "unsafe", "green stamps" as well as IRCs often simply dissapear.

I found that the most releable way to "beat the crooks" was to make the letter look as much as possible like a personal note. Including colored envelopes, perfume (in one extreme case) and hand lettered addressing using the local spellings for place names. I would only go to this trouble if I suspected a problem or on a follow up QSL, but very few of these ever got lost.

I recommend one of the DXers "phrase books" too. Something as simple as "thanks for an enjoyable QSO" in the local language can work wonders on turn around time!

> max out on use of green stamps!

I HOPE that no one actually cashes in any IRCs! Most DXers have a very active market for them. If you want to buy some then send along a request to one the big time QSL managers. Usually they go for around half the selling price (about 60 cents each now?)

80% of DXing is getting the QSL!

They could use this shortcut for ALL upgrades and really cut the paperwork.

I am opposed to this because it does not provide the proper information as readily. The FCC also has to be in a position to re-issue lost CSCE's.

Finally, why put upon one particular class of licensees to keep saying "interim whatever" forever? Silly, annoying, and would cause some people to become inactive.

And doing it to the TECH class privilege set is a BAD CHOICE. Unless the Communicator class grants ALL privileges above 30 Mhz (with NO exceptions whatsoever) then there will be a great need to have that "class" available.

If the FCC did adopt it, I would be writing to my congress critters and complaining that a federal agency is usurping their duty under the Communications Act and that this is no way for such an agency to act.

All of the above, even though true, overlooks one fact - AM works. There is no compelling need to change every aviation radio in the world. If they ever drop AM, they probably skip FM and go straight to one or another digital mode.

1156. Cable-TV Coax as distribution channel project

Newsgroup: rec.ham-radio
Date: 1990-09-14 13:00:30 UTC
From: bpistr@ciba-geigy.ch
Message-ID: <9009141127.AA13481@zit.cigy.>
Source record: 8617

I'm thinking of a nifty project to install when I move into
my new place of residence in CA. In particular, the problem I'm trying
to solve is that I'm always wanting to do some SWLing, but don't want
to spend all my time in the 'shack'. What I'd like to do is to have the
audio from my radio available in all rooms in the house. I can think of
wanting to upgrade this later to include video, and possibly doing remote
control/operation.

What I'm thinking about is using the cable TV coax in the house
as a distribution medium. In particular, taking the cable TV coming from
the outside, and 'add in' a few more channels, that I can use to send
video/audio from my shack around the house. Then I can use TV's in any
room, (even cheapo b/w jobs), to tune the sound that I want. I can think
of nifty things like distributing the screen contents of a PC, (for WESAT
pictures for instance), as well as more mundane video sources like a
surveillance camera mounted outside, as well.

The thing I need here is a box that will mix my incoming cable
signal, (which already has 30 or so channels on it), with some 'new' channels
that I originate myself.

Does anyone have any experience doing this sort of thing? Know what
the appropriate devices are called/cost?

Doing it this way has the advantage that I put all my funding into
the front-end equipment, and virtually nothing into the receivers, (since
I'd probably have TV's spread around anyway, and small ones are pretty cheap
these days). It's real easy to get hamfest parts to build an 'audio-only'
TV receiver as well.

Obviously, I need to solve the problem of a 'reverse channel', but
I'm thinking of doing that either using carrier current technology, or by
putting a single audio carrier on the coax.

Anyone with ideas, please repond to me directly, as I don't get this list
reliably at the moment.

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

PR Docket No. 90-55

In the Matter of
Amendment of Part 97 of the)
Commission's Rules Concerning)
the Establishment of a Code-free)
Class of Amateur Radio License)

REPLY COMMENTS
Submitted by
William A. Tynan W3XO
HCR 5 Box 574-336
Kerrville, TX

The writer submitted comments in the above proceeding, supporting the
general concept of the code-free license but urging that any codefree
license support the following general objectives:

A. Encouraging responsible and knowledgeable people, particularly
young people, to enter Amateur Radio.

B. Leading to an increase in the utilization of the higher frequency
Amateur bands (220 MHz and above).

C. Not increasing the difficulty of entering Amateur Radio for those
who might not be as knowledgeable and technically qualified as
perspective code-free license candidates might be.

D. Not disrupting current valuable amateur activities.

In support of these, I included the following specific recommendations:

1. Limit codefree licensees to 220 MHz and above, as proposed in the NPRM.

2. Design the examination for the codefree license so as to determine that the applicant has a real knowledge of basic radio, electronics and digital theory, rather than having merely memorized the answers to a few questions.

3. If Number 2 can be accomplished, afford the new licensees all the privileges, in terms of power etc. as higher grade licensees on the same bands.

4. Call the new license "Experimenter" NOT "Communicator".

5. If the Commission sees fit to follow the advice of those who have recommended that codefree licensees be given privileges on 6 an/or 2 meters; institute new rules to limit 50.1 to 50.5, 144.1 to 144.5 and 145.8 to 146.0 MHz to narrowband modes such as SSB, CW and AM (same bandwidth restrictions as are in place for the HF bands), retaining the existing CW limitation from 50.0 to 50.1 and 144.0 to 144.1. (The writer believes that such a provision is needed whether or not codefree licensees are given access to 6 and 2 meters, and is presently preparing a petition for rulemaking on the matter.)

6. Retain the Novice Class license, with administration of its exams coming under the VE system. If classes must be eliminated in order to reduce the Commission's work load, eliminate the General, Advanced or Extra Classes. In any case, such action should be the subject of a separate rulemaking.

Although I have not had the opportunity to review all of the responses submitted in this proceeding (not being able to travel to Washington), I have seen a number of them forwarded to me from various electronic mail sources. I will address those that I have been able to examine.

I am aware of the comments filed by the American Radio Relay League and generally support them, especially in their reaffirmation of their recommendation that codefree license privileges begin at 220 MHz. I do not, however, support their acceptance of the name "Communicator" (their original proposal), for the reasons outlined in my comments filed on this docket. I also do not see a reason for a power limitation of 200 Watts. If the examination is comprehensive, as I have urged, there should be no valid reason to limit the power of codefree licensees to anything other than that available to higher class licensees on the same bands. If, on the other hand, the Commission determines that a comprehensive examination cannot be designed, then I submit that codefree licensees should be limited to 10 Watts. Under that eventuality, the name "Communicator" is probably appropriate.

In the comments filed by the Radio Amateur Satellite Corporation (AMSAT), they espouse the concept of a comprehensive examination that tests the applicant's real knowledge of electronics. Naturally I support their position in this facet of the proceeding. AMSAT also

argues for protection of portions of the 2 meter band for weak signal, narrow band applications. I support this as well. They insist, however, that provision be made to provide access by codefree licensees to VHF bands being employed as satellite uplinks. As they point out, there are a number of ways of accomplishing this; from the waiver process, to outright granting of 2 meter privileges to codefree license holders. As stated above, I do not support granting of 2 or 6 meter privileges to codefree licensees because it defeats the objective of increasing the population of the higher frequency Amateur bands. Some kind of waiver, applicable to codefree licensee attempting to communicate through Amateur satellites, might be appropriate, however. Another approach suggested by AMSAT is to grant them blanket use of the satellite uplink frequency segments. Since there is no current way to mandate that licensed amateurs operate in the satellite sub-bands only when attempting to use satellites, I believe that this would lead to disaster in the form of terrestrial interference to satellite operations. The satellite sub-bands would be the only portions of the 2 meter band where they would be allowed to operate. While the waiver approach might carry the same difficulty, the waiver provisions could be made very specific to prevent it.

The comments of Phil Karn KA9Q, although inaccurate and incomplete, are interesting. Despite his many valuable contributions to Amateur Radio and his possession of an Extra Class license, I must conclude that Mr. Karn doesn't understand the hobby - beyond his own narrow area of interest. In his third paragraph, he state; "Code proficiency is no more relevant to operation on the 50 and 144 MHz bands than it is on the frequencies above 220 MHz". I might agree with this statement, if he means that code proficiency IS valuable on the bands above 220 MHz. But, I don't believe that this is his intended message. The entire thrust of his comments is that code is no longer needed in Amateur Radio - not just on VHF. He blames only ITU regulations for retaining a code requirement for operation on the HF bands - and there proposes to lower the requirement to 5 words per minute. I am convinced that he intends to work for the elimination of the ITU requirement, as well as any code sub-bands on HF. The tenor of his entire submission is anti-code in general, not merely pro codefree license. Mr. Karn is either unaware of, or doesn't care about the many who use code regularly on the VHF and UHF bands. Being associated with AMSAT, including being a member of its Board, he must be aware of the important role code plays in operation via the amateur satellites. Indeed, the way many get started on the satellites is through code. It provides a way to construct a simple, inexpensive station, capable of satellite operation. SSB or data communication on the satellites, usually entails the use of expensive commercial equipment. In fact; it is interesting to note that Mr. Karn, despite his close and valuable association with AMSAT, makes only passing reference to satellites. Other VHF/UHF applications of code, the existence of which Mr. Karn ignores, include long haul tropo and moonbounce communication. My long years of experience on the bands above 30 MHz have taught me that code is particularly valuable. Many of

the countries I have worked on 6 meters (101 at current count), I could have only worked using code. If anything, the use of code is even more necessary on the UHF and microwave bands than on the lower VHF bands. On at least one occasion, I have been frustrated in not being able to work a low power station on 1296 MHz about 120 miles away, because his station was not set up for CW operation. I am convinced that codefree licensees will certainly be at a disadvantage on any bands they occupy, unless they are satisfied to limit their activities to relatively short haul voice and data modes, generally based on the use of FM.

I agree with Mr. Karn that codefree licensees should not be considered as some kind of non-real hams. However, I contend that the key to have them accepted as "real hams" lies in a comprehensive license exam. Mr. Karn does not even address this issue in his comments and seems satisfied with the name "Communicator". I assert that the use of the name "Communicator" and a requirement to pass only a relatively simple entry level type examination, is very liable to result in codefree licensees being branded as some kind of sub-hams.

Another, who does not appear to understand what really goes on on the bands above 50MHz is Brian Kantor. He begins his argument for granting codefree licensee use of all bands above 30 MHz with the premise "Since Morse code is rarely used in VHF and UHF communications..." Surely, basing a position on such an erroneous argument should be grounds for ignoring the remainder of his comments. Nevertheless, I will deal with some of his other points. Mr. Kantor, Mr Karn and many others base their argument for a codefree license on the premise that we should do all we can to encourage interest in scientific and technical fields, particularly among young people. I agree with this and it is one of reasons I support a codefree license. However, I would not want it to turn into a CB-like service. That would be counterproductive to meeting the objective. We might get lots of new "hams", but they would hardly be advancing scientifically or technically. My other major reason for supporting a codefree license is to promote greater occupancy of the higher bands. I contend that, if a person truly wants to get into Amateur Radio as a technical hobby and wants to do so without learning code, operation above 220 MHz and a comprehensive technical examination should not be hindrances to that objective. If, however, the objective is to "talk to their friends and family over the radio" then a simple exam and 2 meters is what they want. I submit that if this comes to pass, unless the Commission erects some kind of barrier to FM operation in the weak signal and satellite portions of the band; satellite, long haul tropo, meteor scatter and moonbounce operation will be things of the past. Mr. Karn, Mr. Kantor and many others, who seem to think that VHF/UHF operation is limited to FM and packet (also FM), ignore the impact of turning lose an additional hoard of FMers on 2 and 6 meters without some kind of protection for weak signal narrowband modes. Mr Kantor compounds his lack of knowledge by the following statement: "Even the traditional advantage of Morse for weak signal communication no longer holds true: digital signal processing techniques have yielded communication systems which can be built by the ham experimenter that

will provide reliable communications at received signal strengths far below those at which the human ear can even discern that there is a Morse signal present." THIS STATEMENT IS ABSOLUTELY FALSE. Some day, it may be true. Many VHF operators hope so. There have been many promises over the years for such a utopian scheme that would make moonbounce available to the "average" VHFer (100 Watts and a 12 to 15 dB gain antenna). But, so far, no one has demonstrated such a system. The answer is that more goes on inside the human brain in digging out weak signals than most people realized. Maybe, some day, the process can be implemented on a few chips, and maybe even improved upon; but it hasn't be shown to work that well yet. I won't waste my time and that of the Commission discussing further Mr. Kantor's comments. I am happy to see that he stopped short of proposing that the Commission "ban" Morse code, although he seems to have considered the idea.

I agree with many of the points made by Mr. Kenneth J. Hendrickson N8DGN, although not necessarily with his conclusions and recommendations. I think that he is correct in noting that most technical contributions and articles about them come from amateurs with higher grade licenses. Mr. Robert J. Carpenter W3OTC has also studied this phenomenon, and reached a similar conclusion, which is documented in his comments. Nevertheless, there may be some who can make technical contributions but are inhibited from becoming amateurs by the code requirement. It is to tap these few, that I support the concept of the codefree license. However, as I have stated several times, it should not be based on a simple entry-level exam aimed at appealing mostly to those who want get an Amateur license so they can "talk on the radio". Naturally, I agree with Mr. Hendrickson's comments with regard to code being a very useful mode for weak signal conditions and under conditions where signal spreading takes place, such as auroral propagation. However, I reject his recommendation that the weak signal sub-bands should be off-limits to those who have not passed a 13 word per minute code test. Current Technician Class licensees make up a significant proportion of those active on these bands. (Although, evidence shows that they are not in majority.) I think that it would be a mistake to eject them at this point. I am even in favor of codefree licensees being able to operate the weak signal sub-bands - provided that they do so with SSB or CW (NOT FM). I believe that the more intelligent ones will soon learn that they must have a working knowledge of Morse code in order to make effective use of VHF and UHF frequencies.

Nothing I have seen in the comments of others has altered my convictions as stated in the comments I submitted on this docket. I hope and trust that the Commission will study all of the comments and reply comments, as well as carefully evaluate the ramifications of any proposed course of action on the various facets of Amateur Radio, including that not-very-vocal minority - the weak signal VHF/UHF/microwave operators. Through such a process, it should be able to come up with a decision which will benefit all of Amateur Radio without negatively impacting any group.

Respectfully submitted,

William A. Tynan
W3XO .

That QRM has been heard at this location also on anumber of occasions over the past three weeks. It has always been between 21020-21030 strongest from the north/north east. It has frequently been 20 db S9 on
my TS930s. It would be interesting to get some beam headings on the signal from various locations.

/ hpfcmgw:rec.ham-radio / keenan@alcor.usc.edu (Robert N. Keenan) / 12:31 pm Sep 12, 1990 /
I am looking for a manual for a Lafayette Comstat 25B 11m base radio.
Please let me know if you have one and could xerox it for me. I would
gladly reimburse for costs.

Go to the nearest electronics supply store (not Rat Shack) and look in
the master index for SAMS Photofact CB book sreies to find the issue that
the Comsat was issued in. Buy the book, if it is still in print. If not
in print then find a TV shop or some other older establishment for consumer
stuff repair and plead with them. That's your best bet. Otherwise, guess :-).

From a recent argument for "no-code" licenses:

> Third, the Citizens Radio Service is only one of many other services
> that do not require their operators and users to know Morse Code.
> Others include broadcasting, public and private land mobile (including
> police, fire, GMRS and business band radio), common carrier (e.g.,
> cellular telephony), and aviation. All seem to get along just fine
> without a code requirement for their operators. Why single out CB for
> comparison?
>
If one wants to transmit, then the previous paragraph provides
several ways to "get on the air". I encourage all would-be
"hams" who don't have the willpower/time to learn this simple
required skill, -- --- .-. ... . -.-. --- -.. ., to look in-
to one or more of the above opportunities. They all get along
just fine without the code requirement. Of course, you may
to have some other qualifications.

> Using much the same arguments as the proponents of a no code license
> have been using, a computer science graduate student recently asked
> me why there should be a technical exam as a license requirement.
> He claimed that he did not intend to build or work on radios, but he
> just wanted to be able to use a hand held transceiver to talk to
> people." (Alan Larson, WA6AZP)
>
Handheld transceivers for this purpose my be purchased from Radio
Shack, Service Merchandise, truck stops, etc. There are generally
AM and operate around 27 MHz. The grad student in question will
then be able "talk to people" who feel the same way he does.

I'm afraid I'm not convinced yet, but keep on trying.

In article <108167@philabs.Philips.Com>, rfc@briar.Philips.Com (Robert Casey) writes:
> I have a question: If novices were required to use crystals to generate the
> xmit freq, and assuming that you don't have a really big selection of
> frequencys (i.e. crystals), then how would you go about answering a CQ? If
> you are not on the same freq, then how would you expect the other guy to hear
> you? Keep answering, and wait for the other guy to eventually tune his radio
> and stumble on your answer?

My first rig was a two-tube transmiter, and a general-coverage receiver
(with amateur-band bandspread dial scales!). I only had one crystal for
the transmitter, but managed to make many contacts with my 5 Watt signal.

The method used was to listen near my transmit frequency, scanning perhaps
plus and minus 10 kHz for replys. In the "olden days", when crystal control
was still common, we often operated with a small split.

Actually, I usually didn't send CQ. There was generally enough activity
that I would sit, vulture-like, on my transmit frequency, monitoring for
anybody interesting calling CQ or finishing a QSO.

The VFO was a great invention, indeed!

> [...] Is 3.579545Mhz in the novice band? [...]
> That freq would be a very common crystal, as it is the
> color TV color info subcarrier. If it is, then that might be a contact freq.

Yeah, its in the novice 80M band. I haven't worked 80M (ever!), but have
wondered about that frequency. Just imagine the noise floor, with all those
quasi-synchronised, pulse modulated color-bursts going on, nation/world-wide.
I can imagine it all right, but what's it really like?

By the way, the ancient history I've just related took place circa-1975. I was
on a *tight* budget then! (How come it seems even tighter now?)

Before the
Federal Communications Commission
Washington, D. C. 20554

In the matter of:)
)
Amendment of Part 97 of the) PR Docket 90-55
Commission's Rules Concerning)
the Establishment of a Codeless)
Class of Amateur Operator License)

REPLY COMMENTS BY ROBERT J. CARPENTER, W3OTC

1. I, Robert J. Carpenter, 12708 Circle Drive, Rockville, MD 20850, having submitted Comments on this Docket, now submit these Reply Comments to correct erroneous or misleading assertions made in various other Comments on this Docket. I also wish to specifically endorse certain other Comments which appear likely to make valuable improvements in amateur radio.

NARROW-BAND-EMISSION SUBBANDS NEEDED ON VHF BANDS

2. William A. Tynan urges the Commission to establish narrow-band-emission subbands on all VHF amateur bands. I strongly support his request. He is right in saying that weak-signal experimental communication, usually using these narrow-band modes, is the chosen activity of many of the most advanced amateurs. It is endangered by encroachment from wide band operation such as FM, packet, TV, spread-spectrum, etc. It is vital that the Commission establish the subbands he proposes so that new and old amateurs will be fully aware of them. Many amateurs are either unaware of the ARRL voluntary band plans, or may be so "anti-League" as to purposely ignore them. Only Commission action can protect this important technically advanced facet of amateur radio from the wide-band operators who are unaware of the weak signal operation since their radios only respond to strong signals. Packet and digital users, not listening by ear, have no chance of noticing the narrow-band weak signals, and thus offer a large potential source of interference.

3. The Commission may wonder why it has had few complaints of serious inter-mode interference in amateur radio. The reason is clear: in the past all amateurs listened to their receivers by ear; starting with packet, we see the coming of amateur modes where no person is monitoring before transmitting.

NOVICE AND TECHNICIAN CLASSES SHOULD BE RETAINED

4. I agree with Philip Karn, Brian Kantor, William Tynan, the ARRL and others that the FCC is wrong in proposing to eliminate "lower" amateur classes such as Novice and Technician. These classes provide a valuable with-code entry point and upgrade path. In fact I feel that these entry points are more suitable than any no-code license.

RETAIN ADVANCED CLASS; PHASE OUT GENERAL AND EXTRA

5. I disagree with Philip Karn, Brian Kantor, Gordon Girton, and others, who want to phase out the Advanced Class and keep the General Class. The additional technical knowledge required for the Advanced Class is vital for full-power HF operation. I recommend that the General Class be phased out instead.

6. Philip Karn and others point out that the FCC says that it is only able to process about 50,000 amateur licenses a year, and that the current workload approaches this quantity. It is regretable that the NPR 90-55 text did not reveal this fact, since it would have emphasized the urgency of reducing the complexity of the amateur licensing structure, and the number of incremental upgrades. In this context, the Commission should immediately stop issuing new General and Extra class licenses. They should be grandfathered forever, and separate proceedings initiated to eliminate the Extra class band segments. The Commission should also investigate transferring some or all of the data entry task to the Volunteer Examiner system, or some new form of voluntary support corps from the amateur ranks. The amateur volunteer resources are available, they just need the request and some organization.

7. People should be encouraged to enter ham radio at the highest possible license class, and thus reduce the number of unneeded upgrades, To accomplish this, the Commission should require that (1) all exams be given by Volunteer Examiners, and (2) ONLY TWO EXAM "PACKAGES" SHOULD BE OFFERED: (1) 5-WPM CODE AND THE NOVICE AND TECHNICIAN WRITTEN ELEMENTS, AND (2) 13-WPM CODE AND THE ADVANCED WRITTEN EXAM. Even if only one-third of the applicants qualified for Technician (or a no-code license) instead of Novice on the first try, there would be a major reduction in the FCC's large license upgrade workload.

8. It is wasteful paperwork for the Commission to handle certificates attesting to successful completion of insufficient exam elements to allow issuance of any class of license. How can one justify the expense of keeping a record of partial success, when it is logical to expect an applicant to retain the tested knowledge and skills at least long enough to complete all the requirements for license issuance.

9. William Tynan's arguments against adoption of the name "Communicator" for any no-code license are well-made. The Commission should emphasize the technical aspects of amateur radio, should it find that a no-code license is justifiable. A no-code license should not be a "no-code, no-thought, no-work, just-talk" license. The term "Communicator" gives precisely the wrong flavor as to the goals for a no-code license class.

10. Gordon Girton's suggestion of perpetual Technician operation with a CSCE and call-letter suffix, just seems to add to the problems. The FCC field offices would have dozens of unofficial VEC lists of Technicians to paw through, Technicians would have to submit to code reexamination or at least pay their VEC each year, and the FCC amateur data base and the Call Book would have no record of which Technicians were "current", preventing the traditional self policing of amateur radio. Really a terrible idea. Girton's other suggestions on temporary suffixes and distinctive call letters reek of "administrative neatness", and are useless as I pointed out in paragraph 20 of my original comments.

11. Brian Kantor's suggestion of allowing a no-code "Technician" class license to have "all Novice class telegraphy privileges", including those below 30 MHz, clearly violates the international agreements.

Suggested License Class and Examination Structure

Applicant Already Holds	Package A 5 wpm Code	Package A Novice Written**	Package B 13 wpm Code	Package B Advanced Written**	License Issued
None	Pass	Fail	Not Given		None
None	Fail	Pass	Fail		None
None	Pass	Pass	Fail		Novice
None	Pass	Pass	Pass		Technician
Novice	Waived	Waived	Fail		Keep Novice
Novice	Waived	Waived	Pass		Technician
Novice	Waived	Waived	Pass	Fail	Technician
Novice	Waived	Waived	Pass	Pass	Advanced
Technician			Fail	Not Given	Keep Technician
Technician			Pass	Pass	Advanced
General			Waived	Fail	Keep General
General			Waived	Pass	Advanced

If A No-code Class Is Created Against My Advice:

None	Fail	Pass	Pass		No-Code License*
No-Code	Pass	Waived	Waived		Technician
No-Code			Fail	Not Given	Keep No-Code
No-Code			Pass	Pass	Advanced

* As I amply show elsewhere in these Reply Comments, I oppose any no-code license class.

** The Commission could further simplify matters by having but a single written exam for all classes except Novice. This exam should approximate the current "Advanced" level of difficulty. However, the difficulty of this exam would probably reduce the number of people entering amateur radio.

OUR 5-WPM LICENSES ARE A BETTER SOLUTION THAN NO-CODE

12. Philip Karn and others claim that foreign experience shows that a no-code license has brought many people into amateur radio. This claim cannot be supported by data. In fact in Table 1 and paragraphs 4 and 5 of my original Comments, I presented data that shows that only Japan has a significantly larger number of hams per capita than the US, even though many countries enjoy the "benefits" of a no-code license. If no-code brings so many people into amateur radio, why don't the no-code countries have more hams per capita than the United States?

13. It is not surprising that foreign hams enter the amateur ranks with a no-code license, since their only other choice is usually a 12-wpm or higher code test. In the US we have the 5-wpm Technician and Novice entry points. Great Britain is just now instituting a Novice entry point, with a simple written test like our Novice exam. They are making this change in an effort to reverse the stagnation and aging which has occurred in their amateur population despite having had a no-code license for over 25 years. By having the 5-wpm Novice and Technician entry points, the United States has demonstrated the ability to attract as large a portion of its population to amateur radio as have the no-code countries (Japan excepted), and at the same time has maintained the common skill of cw, which I contend is needed for effective sharing of the amateur bands among the many modes of operation. Just talk to any Japanese operator who is interested in Moon-reflection communication (or other highly advanced communications techniques) about trying to share bands with no-code stations.

IS THE RADIOTELEGRAPH CODE RELEVANT?

14. Of course my answer is "yes". The concept that one is fully capable of operating an amateur radio station without knowing the radiotelegraph code seems like expecting to be licensed to drive without demonstrating the ability to parallel park. I can hear it now: "Parallel parking is irrelevant. I only drive in the suburbs. You never have to parallel park in malls. We have a loop driveway. Why I hardly ever have to back up, much less parallel park! Parallel parking is just a 'hazing' ritual to keep people from becoming drivers." Or mathematics: "Why should I have to learn multiplication and division when I have a pocket calculator?" Despite Kantor's claims, the present 5 wpm requirement is low enough, and does not represent "hazing". Most of the foreign countries with no-code do not have our (better) 5 wpm entry

point.

15. A real likelyhood is that utter and complete ignorance of cw will breed an under-class of amateurs who blunder about the amateur bands unable to comprehend "what those beeps are". Given enough such "communicators", unable to figure out what is going on, the activities of advanced amateurs will be rendered impossible and they will abandon ham radio. As I said in my original Comments, knowledge of the radiotelegraph code is fundamental to the effective sharing of the amateur bands among all the various interests.

16. In his paragraph 11, Philip Karn deprecates learning Morse Code as offering no room for creativity. The same argument could be made for the learning of the FCC regulations concerning amateur radio, or even for learning the English language itself. "I ain't got no reason for English learnin'; them peoples get me good now." Yes, correct English is just another example of rote learning and doesn't offer the room for creativity just demonstrated.

NO-CODE LICENSEES LOWER TECHNICAL LEVEL IN GREAT BRITAIN

17. The experience in Great Britain seems to disprove the contention by Philip Karn, Brian Kantor, and others, that a no-code license would bring in many highly technical amateurs. The British have had a no-code, VHF-and-up license for more than 25 years. It has the same written exam as their full license. I understand that there are approximately equal numbers of no-code and with-code licensees. I have totaled, by license class, all of the authors of all the technical articles in all the 1989 issues of Radio Communication, the most important British amateur radio journal. There were 57 technical articles, 3 were written by no-code licensees, 4 were by foreign hams (most/all held full licenses) and one was written by an unlicensed person. The other 49 were written by full-code (12-wpm) licensees. In fact the authors of over half the papers (29) were licensed before 1964, the date the first British no-code license was issued, and thus could not have even entered amateur radio by the no-code route! If 50% of the British amateurs are no-code licensees, yet they write only 5% of the technical articles, I conclude that the British no-code license is a refuge for less-technically-capable people, even though the minimum entry level is set by the same written examination as for their full license. I doubt that a no-code license would do any better in the United States. It would only offer a lower-effort entry for those who want to "talk on the radio".

18. Philip Karn and others also assert that a no-code license is a way to draw highly-technical people into amateur radio. They have privately complained to me about Table 2 and paragraph 7 of my Comments on PR 90-55. As I understand it, they challenge my

contention that nearly all of the highly technical US amateurs hold 13- or 20-wpm licenses, however they have not furnished me with anything but unsubstantiated, non-numerical counter-claims (lots, many, "I", ...). It seems very unlikely to me that the 5-wpm code requirement keeps many highly-technical people out of amateur radio, when my data shows that most highly-technical people who are already amateurs have no trouble with much faster code. I feel this justifies the conclusion that our present 5-wpm code requirement does not discourage many other highly technical individuals from entering amateur radio. I suspect that Philip Karn's technically-advanced colleagues (his paragraphs 8 and 9) give the code as the reason for not become amateurs as a simple and polite means of terminating the conversation.

ALLOWING NO-CODE ON 50 AND 144 MHz BANDS ILL-ADVISED

19. Philip Karn, Brian Kantor, and others, contend that the characteristics of the 50 and 144 MHz bands do not differ from the higher bands, and thus there is no reason to forbid no-code licensees from operation on these bands. This is false. William Tynan probably knows more than any other person about what is actually happening and being attempted on the amateur bands above 50 MHz. As pointed out in his Comments, the 50 MHz band sees world-wide F-layer ionospheric communication during years of high solar activity. The 50 MHz band sees sporadic-E ionospheric propagation over distances as far as US-to-Europe each Spring, summer, and winter. These conditions are more like those on the 28-MHz band than to the bands above 200 MHz. The 144 MHz band occasionally sees sporadic-E ionospheric propagation. Both the 50 and 144 MHz bands see considerable auroral propagation. In all of amateur radio's history, the E-layer modes have only been seen a handful of times above 200 MHz. F-layer propagation will never been seen on any amateur band above 54 MHz. So, the propagation characteristics of the 50 and 144 MHz bands are often quite different from the bands above 200 MHz, and the long-distance modes on these lower VHF bands often require the use of radiotelegraphy.

20. The Commission must not make frequency assignments (that will not be changed for many years) that only perpetuate the most backward of today's operating habits. The notion that 200 MHz and up is some sort of useless wasteland unsuitable for "real" amateur radio is a know-nothing backward-looking symptom of the lack of initiative in many radio amateurs. No-code licensees on these higher bands would inspire the availability of even cheaper commercial equipment for them, giving even the lazyest amateurs an easy way to join the activity on them.

21. In a real-estate analogy, allowing no-code operators below 200 MHz is like permitting all new construction be in the center-city, no matter how much the crowding, rather than estab-

lishing zoning which requires some to build in the suburbs - for the general public good. And in amateur radio there isn't a cost penalty for using the 50 and 144 MHz bands, as there would be in buying city-center land. There is nothing preventing the addition of 220-and-higher inputs and outputs to the existing 50 and 144 MHz FM and packet repeaters, to fill the alleged population gap on the higher bands. This is commonly done today in the case of 144 and 440 MHz repeaters. Cross linking between bands need only continue until the level of experienced amateur operation on any specific higher band reached a critical mass. The FCC would be failing in its stewardship of amateur radio if it didn't encourage operation on the higher amateur bands by limiting the no-code operators to them.

22. Philip Karn, in particular, espouses a "trickle-up" theory which says that you can increase the use of the bands above 200 MHz by letting no-code licensees operate on the (lower) 50 and 144 MHz bands. He is willing to see this create such chaotic crowding that amateurs will be forced to move to the higher bands. In the first place this violates the Commission's stated intention of not negatively impacting current amateur operation. In the second place, there is ample evidence that allowing a class of license voice operation on a lower-frequency band will depopulate higher-frequency bands. A few years ago the Commission opened part of the 28 MHz band to Novice and Technician voice operation. This has resulted in a reduction in use of the bands above 50 MHz by these licensees. The chairman of the Radio Society of Great Britain's VHF Committee told me that the creation of the 50 MHz band in Great Britain has greatly reduced the population of their higher VHF and UHF bands. Most of their no-code operators moved to the 50 MHz band.

PACKET RADIO PROPONENTS OFFER UNBALANCED VIEW

23. Brian Kantor and Philip Karn do not present a balanced view of amateur radio. Their interest is primarily packet or digital communication. In fact their interest is primarily in the control protocols for this type of communication, which I believe is also their field of employment. This is a very narrow facet of amateur radio. People with these interests often consider the "radio" part of amateur packet radio to be something of an adjunct, and want to use the simplest, lowest technology radio possible. For example, almost all VHF amateur packet radio uses FM-FM modulation (AFSK-FM), one of the least efficient modulation techniques available. Perhaps these people want no-code licensees on the 50 and 144 MHz bands because the "radio" part of packet radio is so secondary to them that they don't consider the greater good that will result from populating the higher amateur frequencies.

24. Yes, these people talk about the wonders of digital signal processing (DSP), but it isn't here yet in amateur radio, and is

still very expensive in the commercial communications world. While great claims are made for the effectiveness of DSP, I have never heard of its practical use in amateur radio, with amateur-priced components, and most of the commercial and government uses are in an environment quite different from the amateur bands. There are a few cases where cheap special-purpose integrated circuits have been developed at a cost approaching a million dollars for specific consumer products such as compact disk players. DSP proponents still use the abilities of a skilled code operator as a standard of performance (see Kantor). But they also often stack the comparison by considering unrealistic receiver bandwidths, etc. Communicating with a hundreds of million dollar satellite on a private frequency isn't a lot like amateur radio.

STATION IDENTIFICATION REQUIREMENTS FOR NO-CODE LICENSEES

25. While researching the technical level of no-code licensees in Great Britain, I came across a requirement of the British licensing regulations that must become part of the US regulations, should the Commission adopt a no-code license. The British correctly assume that, since their no-code licensees have not demonstrated their knowledge of the Morse code, the code they send may be unreadable. Thus, the British require no-code licensees to identify their code transmissions by voice. This means that no-code licensees may only use code in those band segments also authorized for voice. In order that the FCC be able to fulfill its enforcement responsibilities, it too must require that no-code licensees identify, on the same frequency, in voice. This means that no-code licensees cannot be allowed to transmit in any cw-only band segment. This agrees, in part, with the Comments by Kenneth Hendrickson.

CONCLUSIONS

26. The US 5-wpm license classes are a much better solution than the no-code licenses used in other countries, and have resulted in the US being a leader in terms of radio amateurs per capita. Only Japan has significantly more amateur operator licenses per capita, but they are perpetual licenses not indicating current activity.

27. If the Commission persists and lowers the entry requirements by creating a no-code class of license, it should realize:

> It is likely that FM, packet, TV, spread-spectrum, and other wide-band modes will wipe out highly-technical advanced weak-signal VHF/UHF activity unless the narrow-band, weak-signal activity is given subbands specifically protected against these modes. New licensees would be welcome on the narrow-band subbands when using the appropriate operating modes and practices.

> To reduce its processing load, the Commission should require that the Volunteer Examiners give the entry-level examinations as a package, to encourage entry at as high a license grade as possible. It should also attempt to transfer much of the FCC Amateur data-entry load to volunteers.

> Allowing a class of license voice operation on a lower frequency band depletes the population of the higher VHF/UHF bands. Links between present FM repeaters on 50 and 144 MHz, and repeaters on 220 MHz-and-up, will ensure that no-code licensees restricted to operation above 220 MHz will not be isolated.

> In the US, 5-wpm licensees are conspicuously absent from highly-technical amateur radio activities. I expect this to be true of no-code licensees as well.

> British experience shows that no-code licensees write very few technical articles for amateur journals, and thus I presume them to be of generally lower technical ability than the licensees proficient in code.

> No-code licensees, when attempting to use cw, must be required to meet the transmission identification requirements by using voice, since their lack of knowledge of the Morse code may result in unreadable telegraphy transmissions.

NOTICE

I am providing copies of these Reply Comments to all those parties whose Comments are mentioned herein.

Respectfully submitted this 6th day of September, 1990,

Robert J. Carpenter

Because it works just fine, the way it is. Also, the aviation
modulation method and frequencies were chosen in the DARK AGES = < 1936,
before there was stable FM (remember the "AFC" (Automatic Frequency
Control) on FM radios, circa late 50s? I wouldn't have wanted that in
my airplane.

I have Larson 2M and 220 glass mounts on the back window of
my Subaru, directly across defroster wires, strategically placed
to avoid the windshield wiper and low enough to get through my
low garage doors.

If you are pay excruciating attention to cleanliness and get
the glass warm (blow dryer) and dry before mounting, you should
be able to match my installation technique. My 220 has been on
the car 2 1/2 years and the 2m for 2. The 2m was actually mounted
first but turned out to be defective, something we discussed here
a year back. Larson's advice was to place the mounting base
straddling a defroster wire, so that maximum cancelling took place.

Practically speaking, I have never noticed effects from the defroster
wires, but I do notice junk from the rear wiper motor, which could
be fixed if it rained in California occasionally.

Watch out for subtle curves in the glass, if you cannot place
the straight edge of a ruler flat in all directions on your
chosen location, find another location. Adhesion will not be
very good and moisture will get in.

Read instructions very carefully, when they say clean and warm,
they mean it.

Finally, I got a chance to test how strong the mounts were through
stupidity. I drove through what I thought was a police line of yellow
plastic tape. It turned out to be 1/2 or 5/8 nylon rope. That rope
went over the roof of my car, dropped down the back between the window
and the element of the glass mounts, right near the base. It twisted
both elements horribly together and then came unhooked. I stopped
expecting to sweep up glass because of the terrible noise. The mounts
remained attached to the glass and are still running today almost 2
years later. I do find I buy new elements every 18 months or so.

Brian Perkin
N6RSW

P.S. Everyone I have ever talked to has found the Larson elements to
be too long. Expect to do some trimming, in the range of 4 or 5 inches
on 2M. If you put the antennas close together, they will interact.
That's another reason I bought new elements, but that's another story.

Yeah, that's about right. The procedure was to call a LOOOONG CQ and then
spend several minutes "tuning the band" looking for a response.

You got to know really well the other Novices who had crystals on the same
frequencies as yours!

If you're going to be posting programs, why not post them in SOURCE form. That way others can learn from the code, and have a chance of running them on a multitude of different platforms.

You know, "software" homebrew..

Besides, with all of this virus crap running around, I wouldn't run a program that I didn't compile myself on MY computer..

> antenna tuner without causing damage to the rig or myself!

Point #1 is not to try to tune up a Swan 500 to its rated 500 Watts! They are driving the pants off the sweep tubes at that level. Most Swan 500 users limit themselves to about 350 Watts input, which should give you pretty close to the legal limit for Novice/Tech anyway (200 W output).

As I recall, the Swan 500 is a conventional PI-network output. The traditional tuning method is first to turn the plate loading control to minimum (counter clockwise). Now set the function switch to "TUNE" (or go to "CW" and press the code key, I forget how Swan does it) and increase the drive slightly until you get a small increase in plate current. IMMEDIATELY adjust the plate tuning control for a *DIP* in plate current. Never allow significant plate current to flow with the plate tuning misadjusted.

Now increase the drive control all the way and increase the plate loading control. The algorithm is to keep increasing plate loading (which increases plate current) while re-dipping the current with the plate tuning until you reach the desired input power level. (Input power = plate volts times plate amps.) Now decrease drive level until plate current just begins to drop.

On SSB, adjust mic gain (drive level) until the ALC meter reads slightly upscale on voice peaks.

I am interested in obtaining a crystal filter for a homebrew IF project. I would prefer a 10.695MHz as used in the Kenwood TR-751, TR-851, or the 16.3MHz or 16.9MHz used in other Kenwoods. I feel the simplest way to get one is to order one as a repair part from the manufacturer. The application is FM, and I would appreciate any info with Manufacturer, radio model number, and part number for the filter. Any make/model and frequency between 10 and 18MHz will do. Thanks in advance....KM4JN

(hint: its a DSP modulated DDS project).

1173. Stepper Motor Information Requested

Newsgroup: rec.ham-radio

Message-ID: <9009141911.AA19945@ucsd.edu>
Source record: 8484

I'd like to get some references on articles covering stepper motors,
both how they work, and practical `how-to' information.

As of this time, here are the sources that I already know about:

Publication Issue Page Comments
+-----------------------+-----------+------+---------------------+
Sky & Telescope May 1989 554 "Gleanings For ATM's"

Electronics World + June 1990 527 "Circuit Ideas"
Wireless World (`WW')

I'm hoping that someone will know about a series on stepper motors
that's been run in one of the electronic magazines. References to
readable books on the subject would also be appreciated.

If anyone cares to repond to this query, it would probably be better
to send the information directly to me, so as not to clutter-up the
Digest with information that's not of general interest.

Thanks,

Paul Nix (WB5AGF) InterNet: nix%muppet.decnet@consrt.rok.com

Actually, I would guess that the nutshell qualification for homebrewing is that the project should require debugging (at least potentially, for those who actually get things right the first time). (Though we should exclude the complete incompetants who can't connect anything together, otherwise the folks who couldn't operate a split-VFO ricebox during the infamous Bouvet Island incident would be "homebrewers" :-).

For example, someone opined that just building a kit or a magazine project isn't really homebrewing. To some extent that is true, but frequently kits require some debugging as well, which requires you to actually try to understand what's going on in the circuit. I bought a QRP transceiver kit some time back which never worked quite right (VFO instability when transmitting), and I had to screw around with it for quite some time, trying different buffer amplifiers, shields, etc., before rendering it completely unusable :-S... A more "pure" example of homebrewing would be my current project; I built a 10MHz VFO (the 7MHz VFO from the QRP Notebook; I didn't change the circuit itself, but I had to derive the correct capacitor and inductor values, and discovered a couple of minor problems not discussed in the text). The first VFO turned out to be rather unstable when checked with a frequency counter; so I poured over all of my references, and listed a number of things that I seemed to have done wrong*, and built a second copy, which performed much better -- though still not good enough, so I will have a third go around (at least), this time with some notable changes in the circuit itself. Despite still not having a working VFO, I've learned a lot from it, (indeed, things I couldn't really learn from the references at hand [see below]) and that's the point.

* For example, I used a cheap double-sided PC board for the first one, and one reference says that having a ground plane like that will result in lots of uncontrollable temperature-sensitive capacitors (of course, another reference says that double-sided boards are fine for VFOs), and that you should use fiberglass-epoxy; the second try used single-sided fiberglass.
I also had the VFO tank toroid lying down on the ground plane, and my books disagreed about whether or not the "self-shielding" capability of toroids went quite to such an extreme; the Mark II had the toroid vertical and well away from other components.
The most likely killer, however, was trusting Active Electronics "NP0" capacitors; they list the AVX part numbers that specify NP0 characteristics for some of their capacitors, but the circuit got a *lot* better when I

used ceramic disks with the little black mark on top...

> that we have some airspace in which to do this, especially with trans-
> mitters that can put out more than 100 mw of power (up to 1.5 KW) right
> out of your own brain/junkbox/workbench!

Hey, what's wrong with 100mW? Didn't you see the fairly recent article in QST about QRP operation, where they talked with one guy who is working on WAS with a 50mW rig? And who once used a 400x (CMOS inverter, whatever the number is) as his oscillator and "P"A? [Take this complaint with a small grain of salt, of course; there is obviously room for KW rigs in the homebrewing world]

RE: local Channels in your cable TV system for ham use.

I have seen similar things done. Several options apply.

1. Using a VCR output, the composite video was added to the system through the same type of splitter that one would use to hooke one cable to two TVs. I have seen some back feed from this into the system, so you may want to put an amplifier before the splitter/combiner to prevent unwanted viewers.
We used this system in Alaska in a dormitory to have our own 'blue' channel. (This will only work if channel three or four is not in use already).

2. Buy or build your own modulator for the channel of your choice, preferably one not used by the existing system. Use a combining amplifier to add the channels together.

Depending on how much you want to spend, you can get real extravagant with this. Commercial notch filters are available which will completely remove an existing channel, such as a scrambled pay channel you do not subscribe to. you can then add your channel over it. Modulators are expensive. We have two of them in a local application which take either seperate or composite video/audio inputs and provide an output on any cable or broadcast channel. They ran about $800.00 each.

I have seen one ham application in use where the individual used a VCR and fed the output of a Commodore 64 into the video in for packet and his scanner output into the audio jacks. He then hooked it through a radio shack splitter to his cable system. This allowed him to record up to 8 hours of scanner/packet, plus view it and hear it on a small b/w TV in his living room. This worked quite well. In fact, I plan to do something similar in my house.

Good luck.

I'm one of those previously rock bound old farts (37 yrs old type).

When I called CQ, I used to tune around my xmit freq. a few hundred cycles or so. I only answered CQs if I had a crystal very close to the transmitting frequency.

Most novices I knew had a good supply of crystals and a VFO shoved off somewhere in the shack..... but then, that's another argument.

Just because they got an NAL doesn't mean they have to pay it. They can
challenge it in administrative law court, and ultimately appeal to
the US courts. Of course, at this point there's not much way out
other than something that will cost.

However, I have seen an NAL thrown out just from some jawboning, so
it still isn't final.

I do hope they get the bastards, anyway.

Just as an added extra comment, my understanding of how FCC works is
as follows. The FCC will not publicize someone receiving a Show Cause Notice.
(commonly called a pink slip ;-) Once the individual receiving the
pink slip doesn't respond or continues along their merry way THEN
they receive the forfeiture. This is when the information will finally
become public knowledge, i.e. if you find out about the forfeiture
it means a real fine.

copied from packet:
From: n2kzh@kb1bd.nj.usa.na (Bryan Todd)

THIS MOD IS FOR THE ALINCO DJ-500T, IF YOU HAVE LITTLE OR NO SOLDERING
EXPERIENCE DO NOT !!! REPEAT DO NOT TRY THIS MOD ON YOUR RADIO. IT IS
NECESSARY TO REMOVE A CHIP RESISTOR FROM THE CPU BOARD.

TOOLS YOU WILL NEED: # 0 PHILLIPS SCREWDRIVER
25 WATT SOLDERING PENCIL,
EXACTO KNIFE.

I RECEIVED A SCHEMATIC AND BOARD LAYOUT FROM ALINCO FREE. PHONE
1-213-618-8616. OR SEND A SASE TO ME AT : BRYAN TODD 318 ALDRICH ROAD
HOWELL, NJ 07731 AND I WILL SEND YOU A COPY OF THE BOARD LAYOUT.

1. REMOVE THE BATTERY PACK
2. REMOVE 3 SCREWS FROM THE BACK OF THE RADIO
3. REMOVE 2 SCREWS FROM THE BOTTOM (FRONT PANEL SIDE)
4. SPLIT THE CASE CAREFULLY.
5. PUT THE RADIO FACE DOWN ON THE TABLE WITH THE TOP AWAY FROM YOU.
THE SPEAKER AT THE BOTTOM.
6. FIND THE "D" SHAPED GOLD PADS UNDER THE SPEAKER ON THE RIGHT SIDE OF BOARD.
7. THE CHIP RESISTOR IS TWO PADS UP FROM THE "D" SHAPED ONES.
THE NEXT STEPS CAN CAUSE GREAT ILLNESS TO THE RADIO !!!!!
8. VERY CAREFULLY HEAT ONE END OF THE CHIP AND PRY WITH KNIFE.
9. THEN HEAT THE OTHER END AND REPEAT UNTIL RESISTOR IS OFF THE BOARD.
10. HOLD THE BATTERY PACK IN CONTACT WITH BOTTOM OF RADIO, TURN ON RADIO,
